

The background of the slide features a vintage map with a compass rose in the upper left corner. The map is aged and yellowed, with various geographical features and labels visible, though they are out of focus. The compass rose shows cardinal and intercardinal directions (N, NE, E, SE, S, SW, W, NW) and degree markings.

Architecture and Features of an Extensible Measurement System Framework

Jerzy M. Nogiec

Batavia, August 2007

Vision

- Replace the existing magnetic measurement systems by new systems, which are developed based on the same technology and allow for high level of reuse and accommodation of various hardware and data processing solutions.
- Allow for easy extensions and modifications needed in R&D.
- Allow for flexibility in data management.
- Base the solution on open systems and standards.

Extensible Measurement System (EMS)

EMS is a component-based framework for building measurement, data acquisition and dataflow processing systems. The goal of the EMS project was to design, implement, and deploy a system that is extensible, flexible and dynamic. EMS can be used to develop configurable and dynamically reconfigurable systems. It is perfectly suited for building a family of systems.

Framework – the skeleton of an application that can be customized and reused.

Component – an independently released software module suitable for composition (together with other components) into multiple applications.

Family - a group of systems built based on common software assets, such as frameworks, components, or libraries.

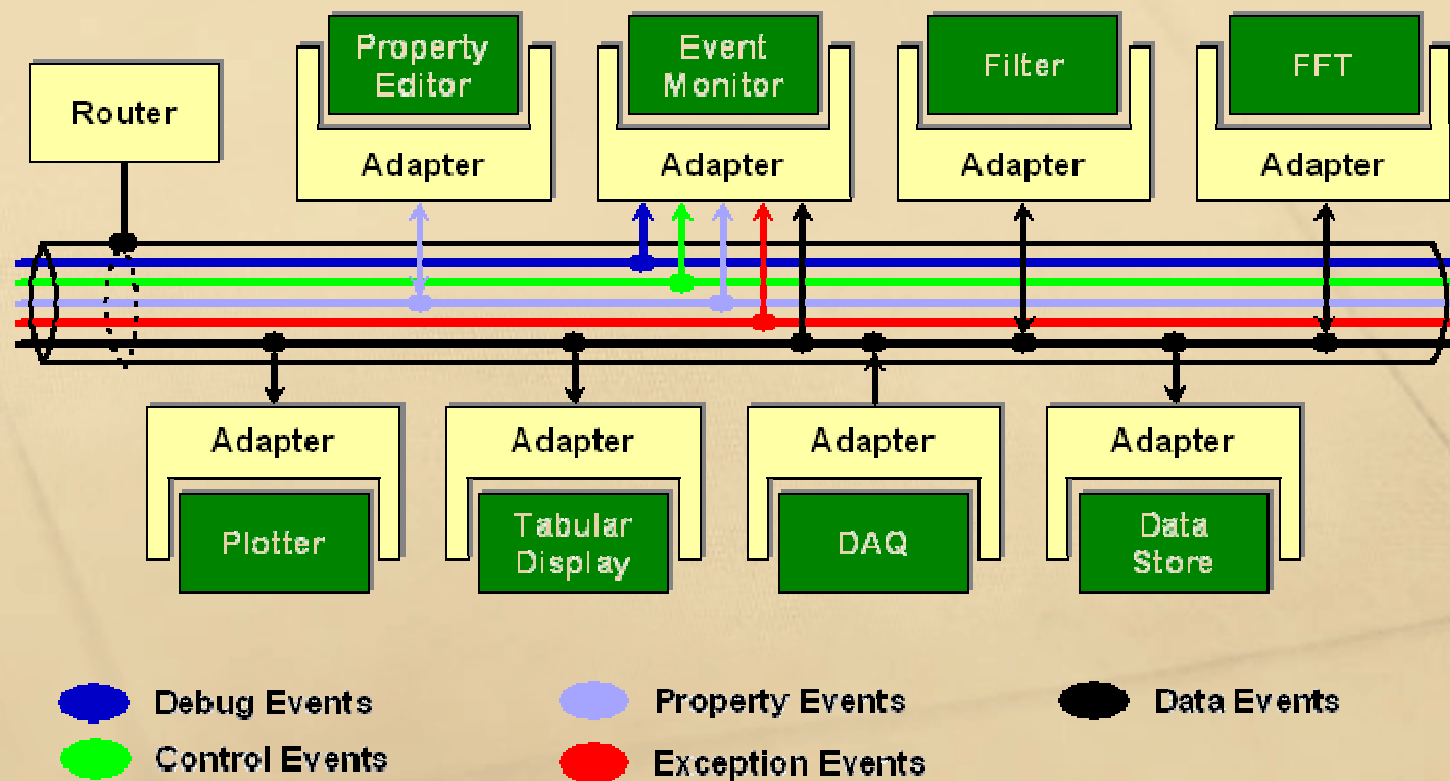

The background of the slide is a vintage map with a compass rose in the upper left corner. The map is aged and yellowed, with various geographical features and labels. The compass rose shows cardinal and intercardinal directions. The text "IMMW-15" is overlaid in the top left corner.

IMMW-15

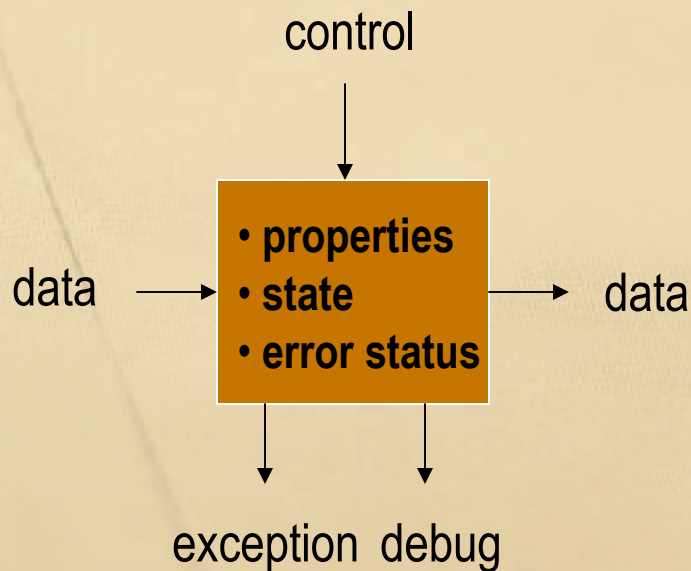

EMS Architecture

Batavia, August 2007

Architecture

Component

Components have properties and state. Typical components input, process, and output data. Their behavior depends on their state and property values. Components can be directed to perform certain actions by sending control events to them. Components may also output debug and exception information.

Dataflow

filter

splitter

merger

source

sink

There are several categories of data processing components:

- Data sinks
- Data sources
- Data filters/processors
- Data splitters
- Data mergers

XML Dialect

```
<configuration version="0.1" title="Display Test XML">
  <!-- Component definitions -->
  <component id="Producer" class="ems.core.components.SimpleDataGenerator">
    <property name="title" value="Data Generator Component"/>
  </component>
  <component id="Chart" class="ems.measurement.chart.ChartDataDisplay">
    <property name="XPosition" value="0"/>
    <property name="YPosition" value="200"/>
    <property name="title" value="Plot Display"/>
  </component>

  <!-- Routing information -->
  <route type="Data" origin="Producer" destination="Chart" />

  <!-- Control signals -->
  <control signal="init" destination="!"/>
  <control signal="start" destination="!"/>

  <groups>
    <group name="Display" position="778,423" size="548,219">
      <node name="Producer"/>
      <node name="Chart"/>
    </group>
  </groups>
</configuration>
```

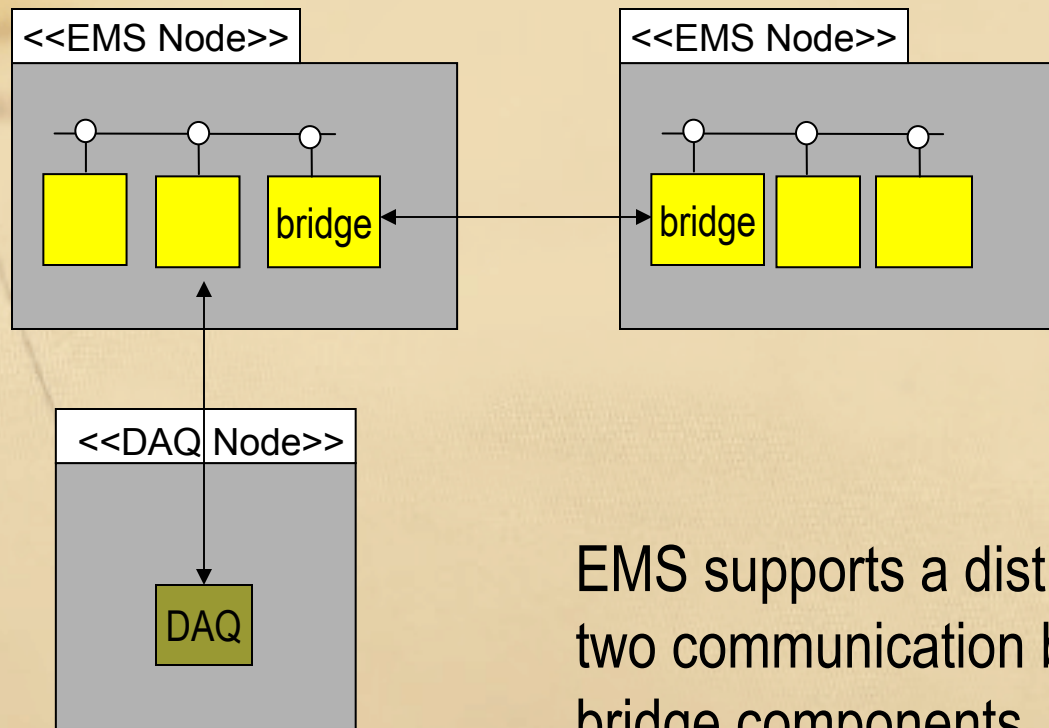

DAQ Organizations

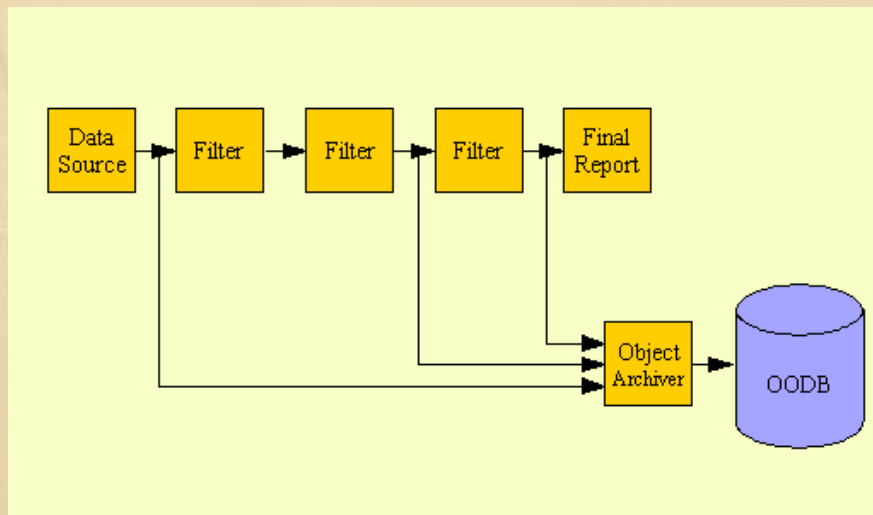

EMS supports both distributed and local DAQ architectures.

Distributed EMS

EMS supports a distributed solution where two communication buses are connected via bridge components.

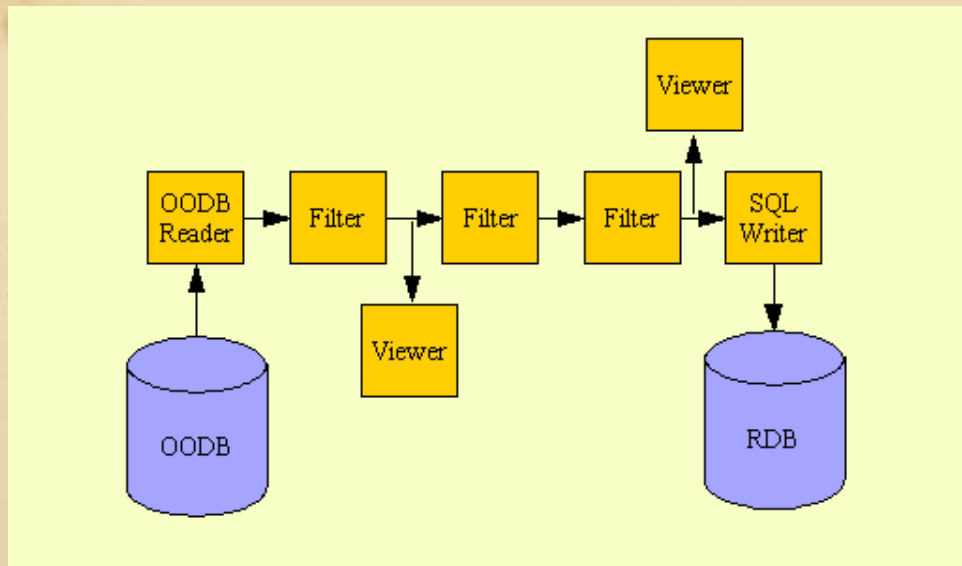

Streaming to OODB

Data from any point in the data flow can be archived in OODB with no need to do any special preparations of the database (no alterations to DB schema, no programming of DB access, etc.)

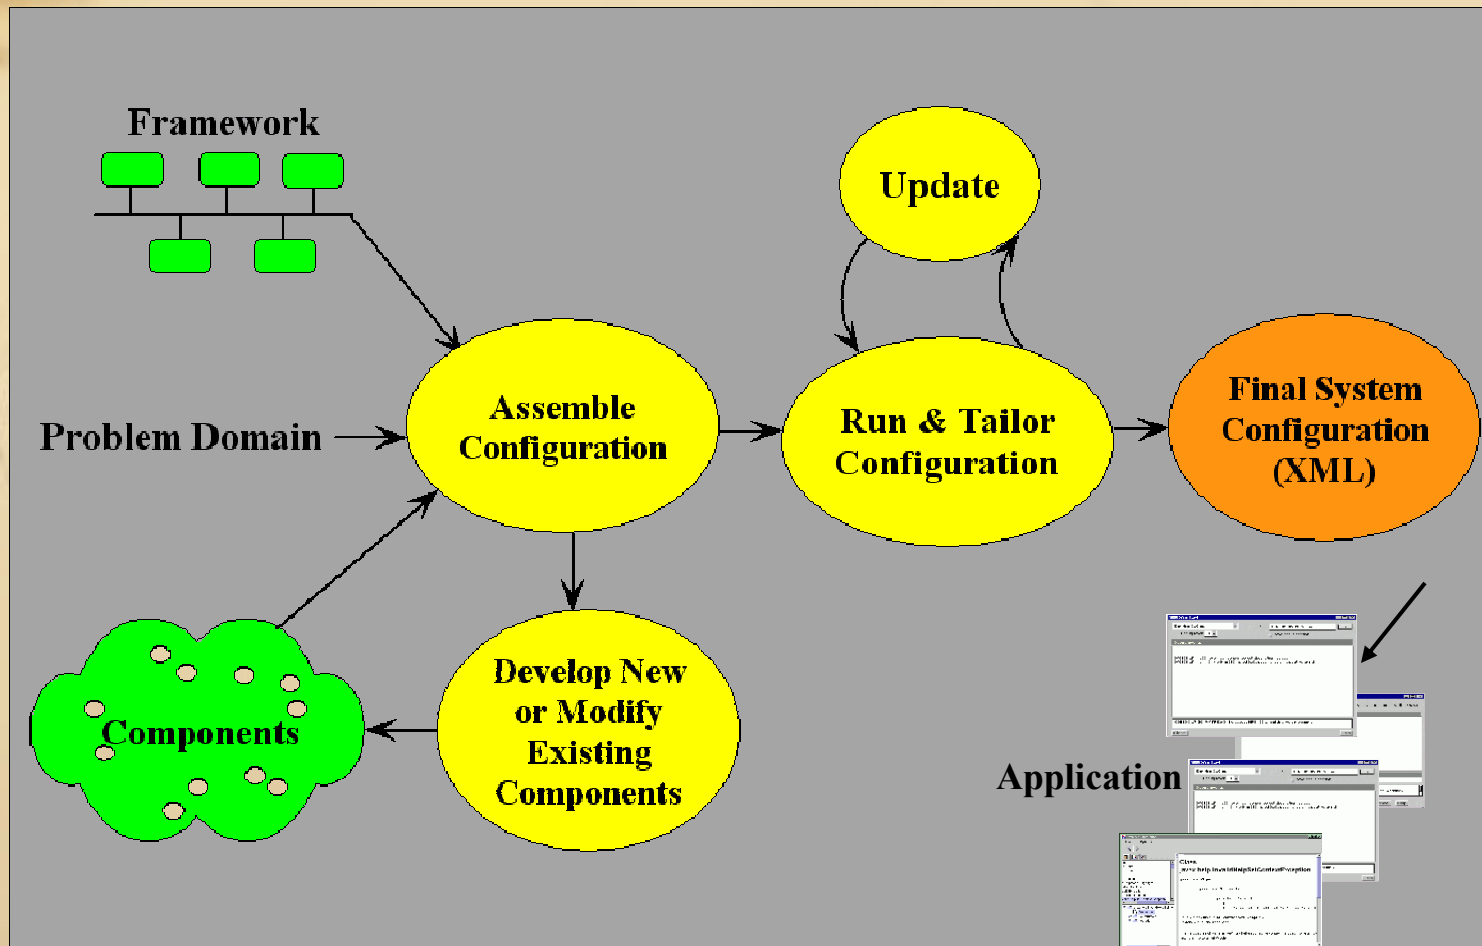

OODB offers fast persistence of data streams.

Data Publishing

- ◆ Data (final results) can be loaded either on-line or off-line to a relational database.
- ◆ A component can be set up to apply the same SQL statement to a stream of data.

Application Lifecycle

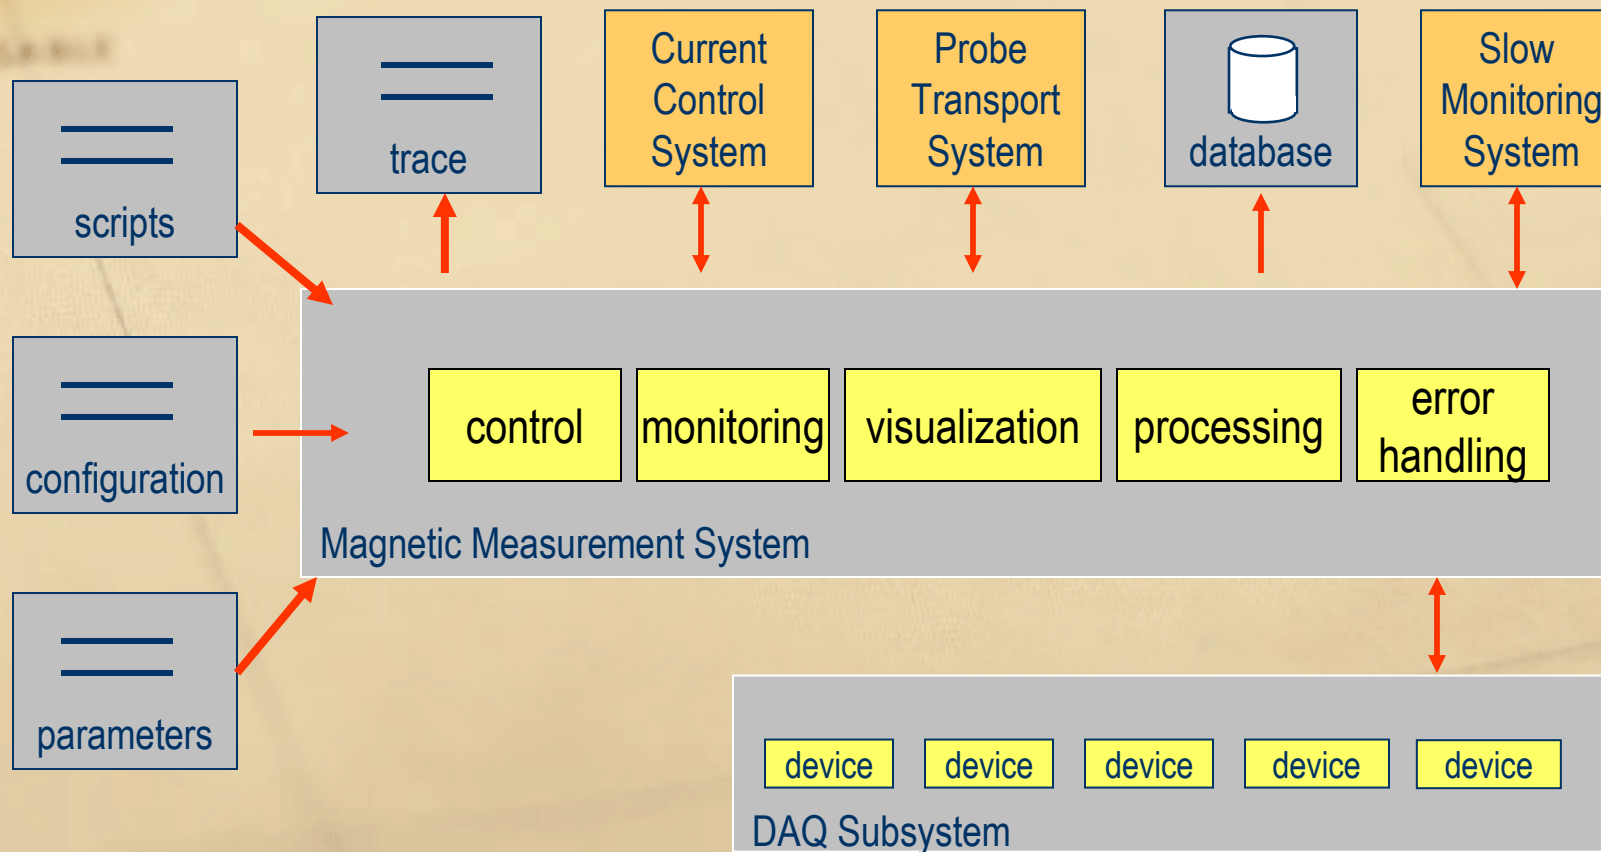

The background of the slide is a vintage map with a compass rose in the upper left corner. The map is aged and yellowed, with various geographical features and labels. The compass rose shows cardinal and ordinal directions. The text 'IMMW-15' is overlaid in the top left corner.

Configuration with No Groups

XML Configuration View

On-line Component Documentation

The screenshot displays the Visual Configurator application window titled "Visual Configurator - boosterCorrector_070719.xml [C:\Documents and...]. The interface includes a menu bar (File, Edit, Routes), a Filter pane on the left listing various components, and a central workspace showing the configuration for the "ems.core.components.system.displays.EventMonitor.EventMonitor" component. The configuration pane on the right shows settings for the "ReportComponent" and "BasicDataComponent".

Component List (Left Pane):

- AnotherDataGenerator
- AxisDetermination
- ButtonPanelComponent
- CalculateSswStrengths
- Chart
- ChopDataEvent
- CollectStats
- ControlEcho
- ControlSequenceComponent
- CurrentControlComponent
- CurrentControlGui
- CurrentControlSimulator
- CurrentSimulator
- DMCSGatewayComponent
- DaqAdaptor
- DaqTriggerControl
- DataItemFilter
- DataItemInjectorComponent
- DataItemSelectElements
- DataItemsToXmgr
- DataMerger
- DataPacker
- DataSlicer
- DataStreamerComponent
- DataToText
- DataTypeTranslator
- DigitalBucklingComponent
- DisplayPanelComponent
- DspControl
- Echo
- EventMonitor
- EventToData
- ExampleProcessingComponent
- Executor
- Extender
- FIRFilterComponent

EventMonitor Configuration (Central Workspace):

IMMW-15

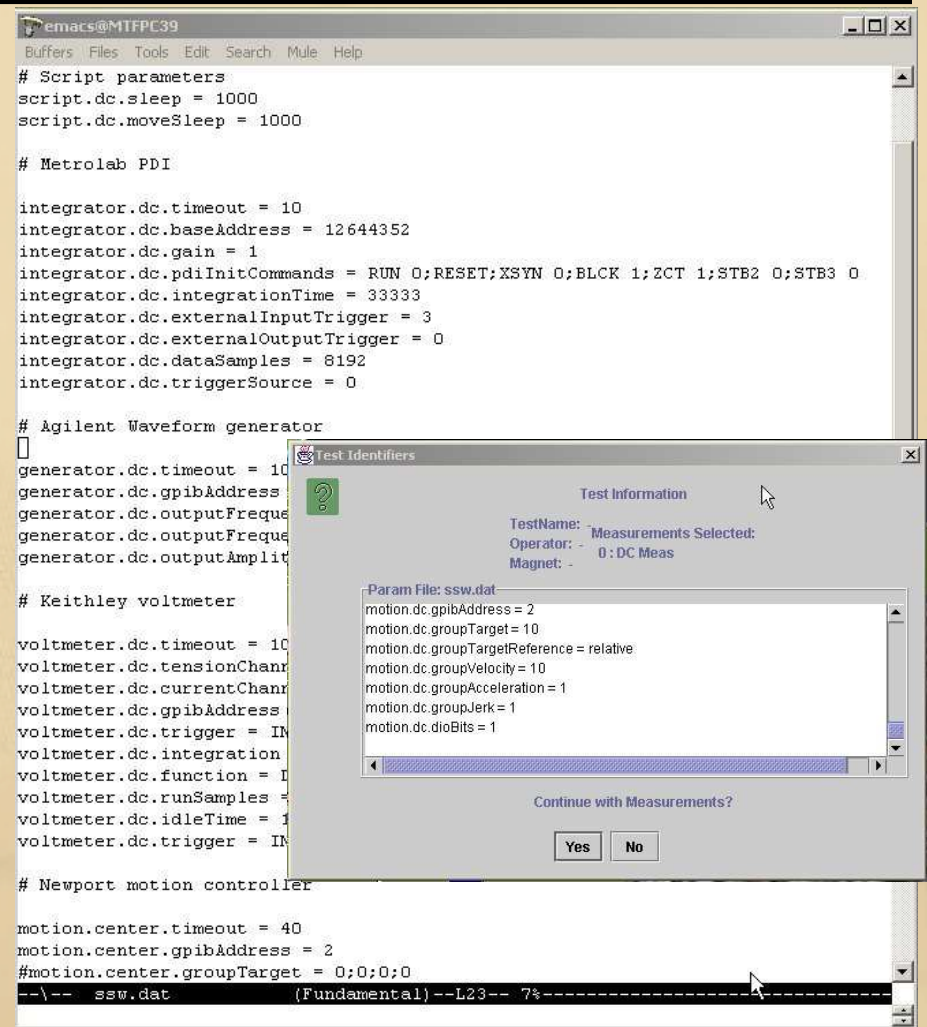

Running Applications

Batavia, August 2007

Measurement States and Parameters

- ◆ Measurement parameters are implemented as property values of components specified for named system states.
- ◆ Parameters can be reviewed before each measurement and updated.
- ◆ A hierarchical notation is used for parameters.
- ◆ Properties/parameters can be also given on the command line:

```
ems.bat ssw.xml "Store.fileName=my_ssw.dat"
```

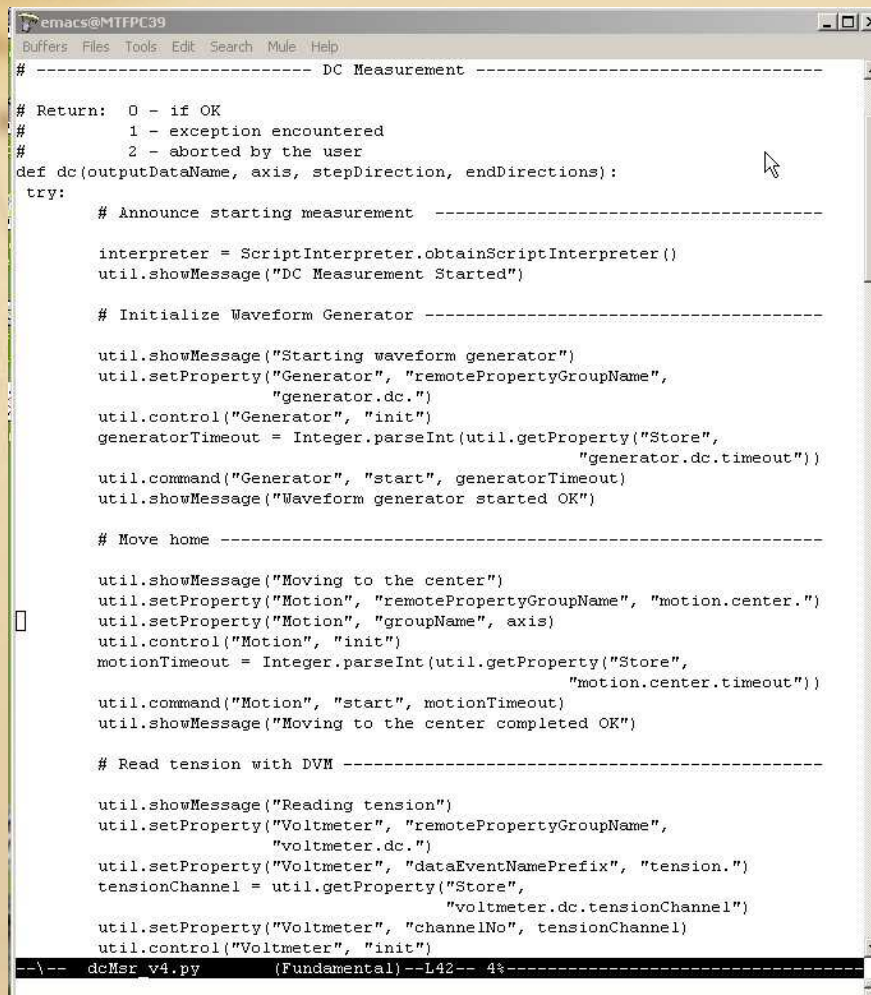

Run-time Application Monitoring

- ◆ Communication on the bus can be selectively monitored using the event monitor component.
- ◆ Memory usage can be monitored using the memory monitor component.
- ◆ The processing time used by a component can be monitored.
- ◆ Debugging and/or exception information can be routed to a separate display or I/O component.

Scripting

```

```

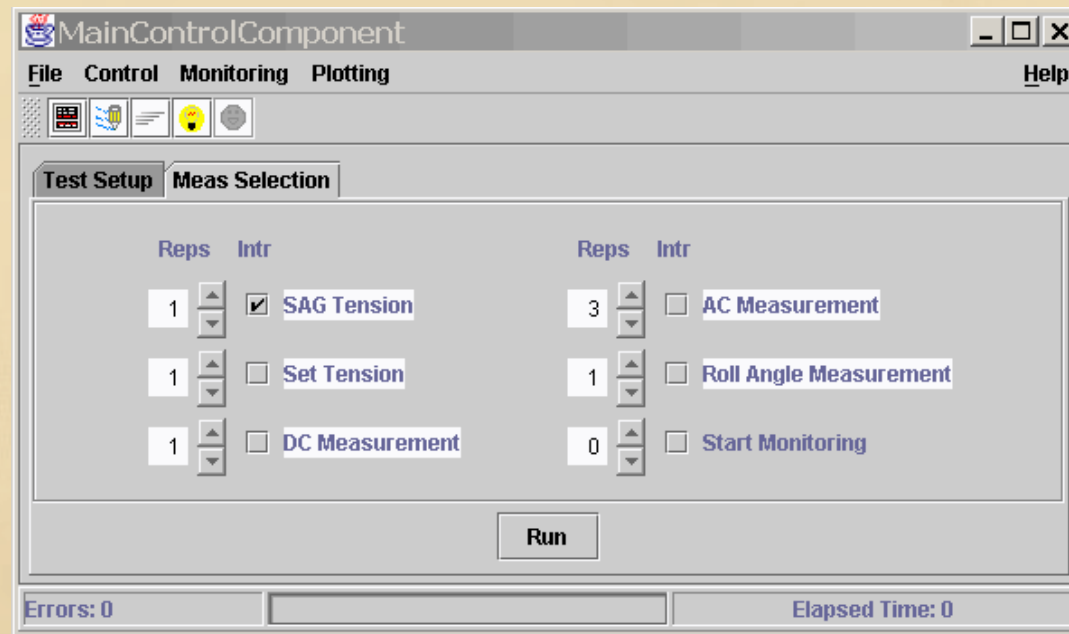

- ◆ Scripting allows for automation of measurements and for quick construction of new tests or data processing logic.
- ◆ The script interpreter is responsible for interpreting Python/Jython scripts.

Script Console

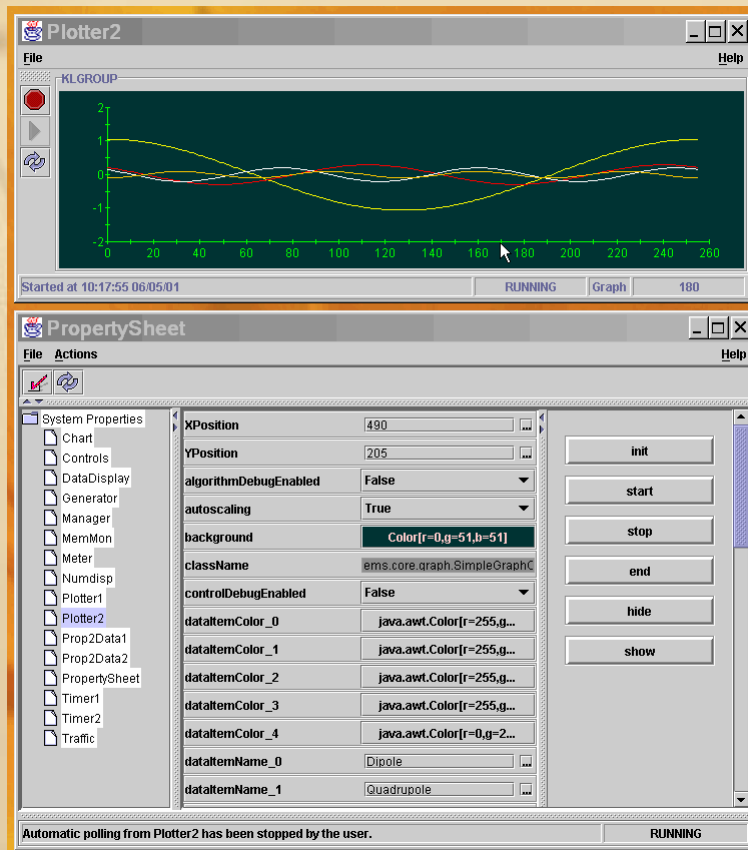

The script control panel component allows for selecting, running, and monitoring a script.

Configurable Sequences of Measurements

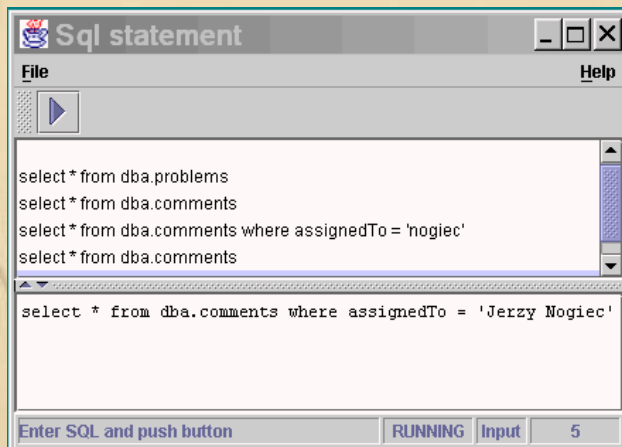

- A script can run in interactive or automatic mode.
- A sequence of measurements can be selected.
- Measurements can be repeated.

Run-time Tailoring

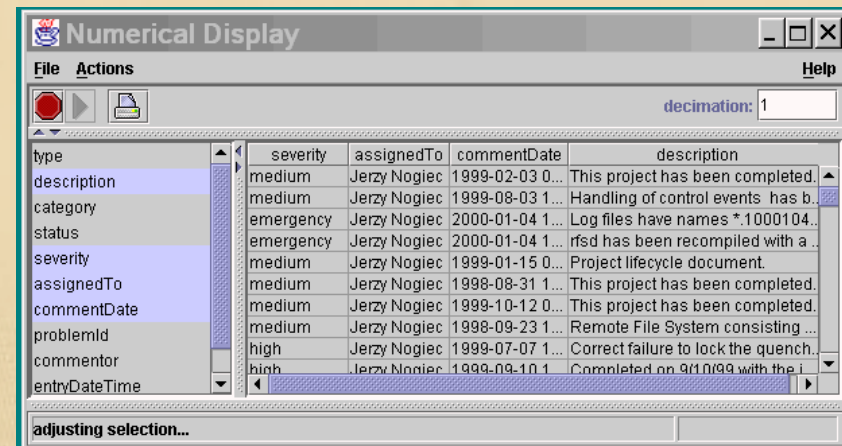

Each component has a set of properties that both control its behavior and exhibit its state. These properties can be introspected and modified at run-time.

Ad-hoc Database Queries

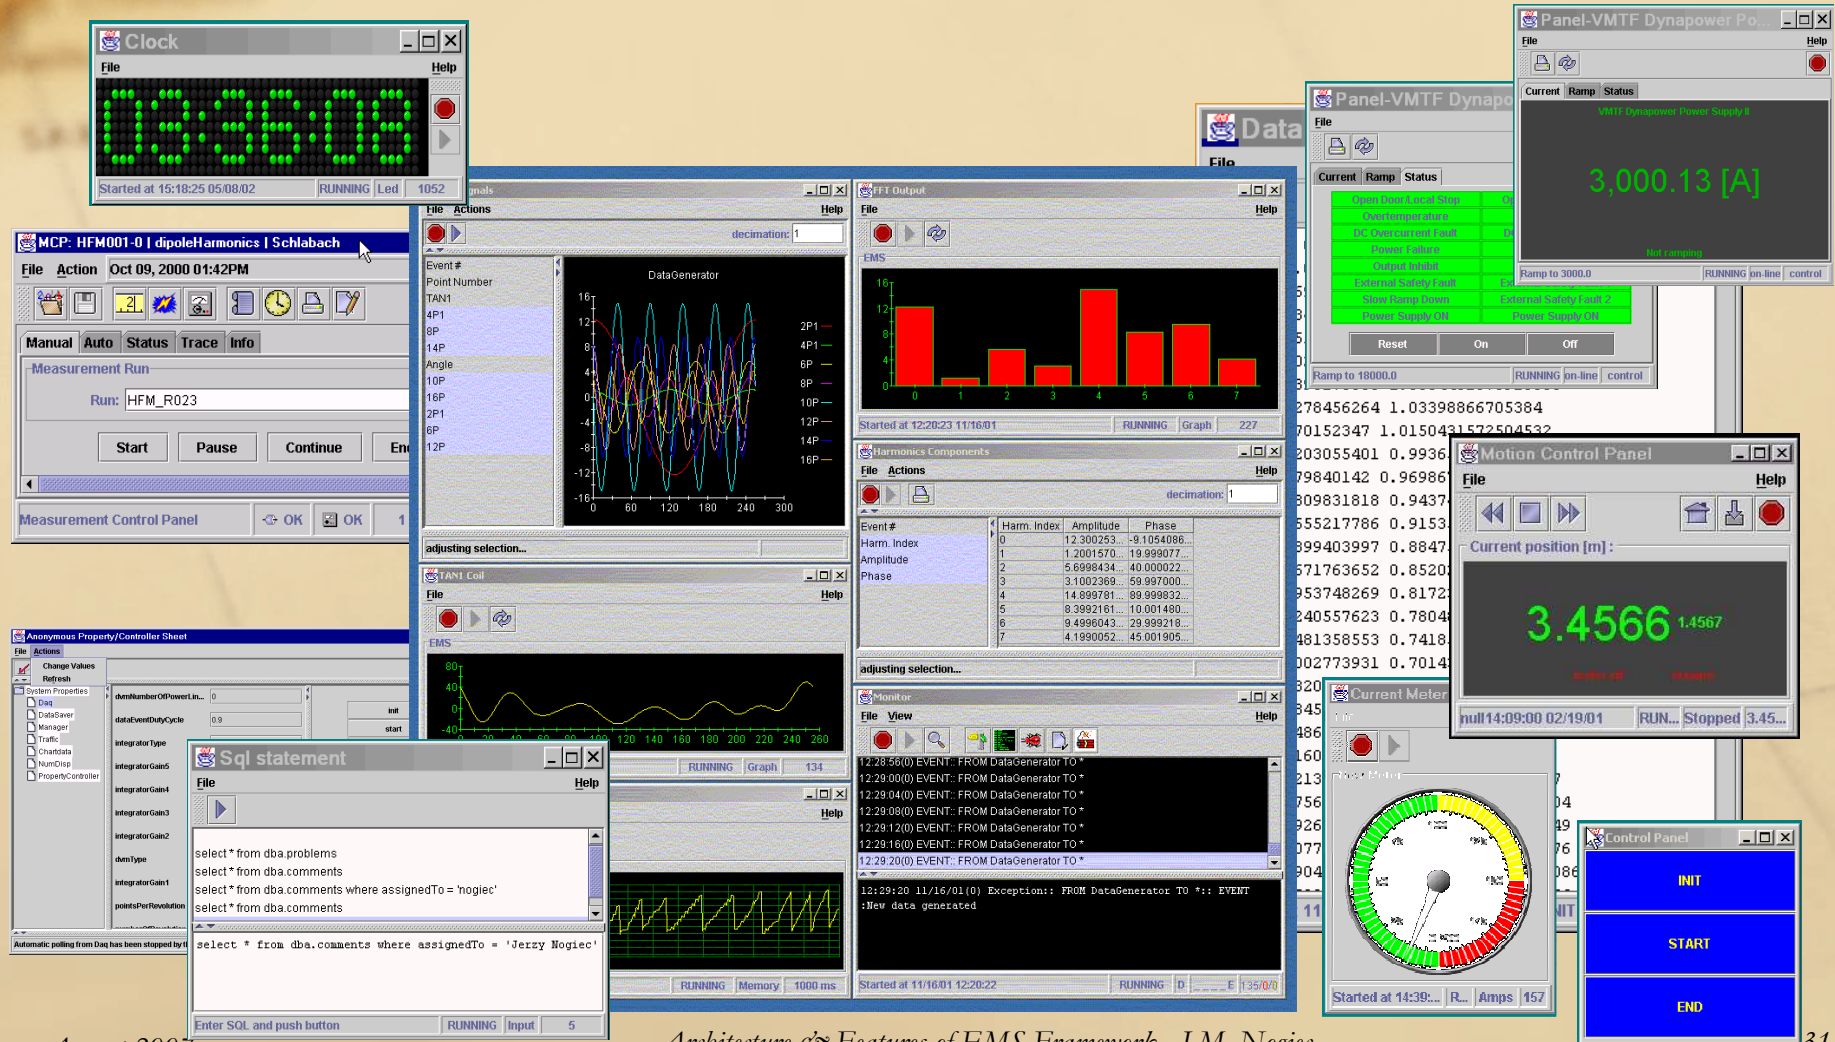

▲ ListInput – query input

▲ TabularDisplay – query results

Architecture & Features of EMS Framework, J.M. Nogiec

Example UI: Tile Configuration

The background of the slide is a vintage map with a warm, yellowish-brown color palette. In the upper left corner, a portion of a compass rose is visible, showing degree markings and cardinal directions. The map features various geographical labels, including "CAPE SABLE" and "PORT JACQUES".

IMMW-15

WrapUp

Batavia, August 2007

Features

- **Multilanguage implementation: Java (framework), C/C++(DAQ), Python (scripting)**
- **Framework portability (Linux, Windows, Solaris)**
- **Self-describing data (collections of named data items)**
- **Non-programmers can visually configure (build) measurement applications.**
- **The user can save any new data without the need to modify the database schema.**
- **Universal components accept any collection of data items.**
- **Applications can be further tailored at run-time.**
- **Alternative configurations allow for several versions of the same measurement .**
- **Various DAQ solutions, either local or remote.**
- **Testing in the simulation mode**
- **Measurement sequencing via scripting**
- **Reuse of components for on-line and off-line processing**

Summary

- EMS is a flexible component-based framework for building dynamic systems.
- EMS is suitable to be both a R&D and production measurement framework.
- The system has been applied to building measurement systems where continuous data streams are processed in real-time.
- EMS, due the selection of its platform (Java), guarantees long-term supportability of solutions, and independence from changes in OS trends and proprietary technologies.
- EMS promotes reuse and RAD.

The background of the slide is a vintage map with a compass rose in the upper left corner. The compass rose shows cardinal and ordinal directions (N, NE, E, SE, S, SW, W, NW) and degree markings. The map itself is aged and yellowed, with some text visible, including "CAPE SABLE" and "BAY OF ST. LOUIS".
