# Fermilab ν Program

- The Fermilab Long Baseline Neutrino Oscillation Program tries to understand the whole oscillation picture in stepwise fashion
  - MINOS - verify oscillations, measure parameters in the atmospheric sector
  - NOvA - measure  $\sin^2(2\theta_{13})$  (or set much better limits) and make first attempt at mass hierarchy
  - LBNE - better sensitivity to mass hierarchy, first attempt at CP violation
  - Project X - extend the reach for mass hierarchy and CP violation to lower values of  $\sin^2(2\theta_{13})$ ; builds on infrastructure of LBNE

# Fermilab ν Program

- The Fermilab Long Baseline Neutrino Oscillation Program tries to understand the whole oscillation picture in stepwise fashion
  - MINOS - verify oscillations, measure parameters in the atmospheric sector
  - NOvA - measure  $\sin^2(2\theta_{13})$  (or set much better limits) and make first attempt at mass hierarchy
  - LBNE - better sensitivity to mass hierarchy, first attempt at CP violation
  - Project X - extend the reach for mass hierarchy and CP violation to lower values of  $\sin^2(2\theta_{13})$ ; builds on infrastructure of LBNE
- For their goals, the last three programs must focus on the subdominant channel  $\nu_\mu \rightarrow \nu_e$  (and charge conjugate process)

# Neutrino CP Violation and the Universe

The universe contains nucleons, *but practically no antinucleons*, making it safe for life.

The development of this matter-antimatter asymmetry requires *CP violation* (matter and antimatter must behave differently).

The observed *quark* CP violation cannot explain the cosmic nucleon-antinucleon asymmetry.

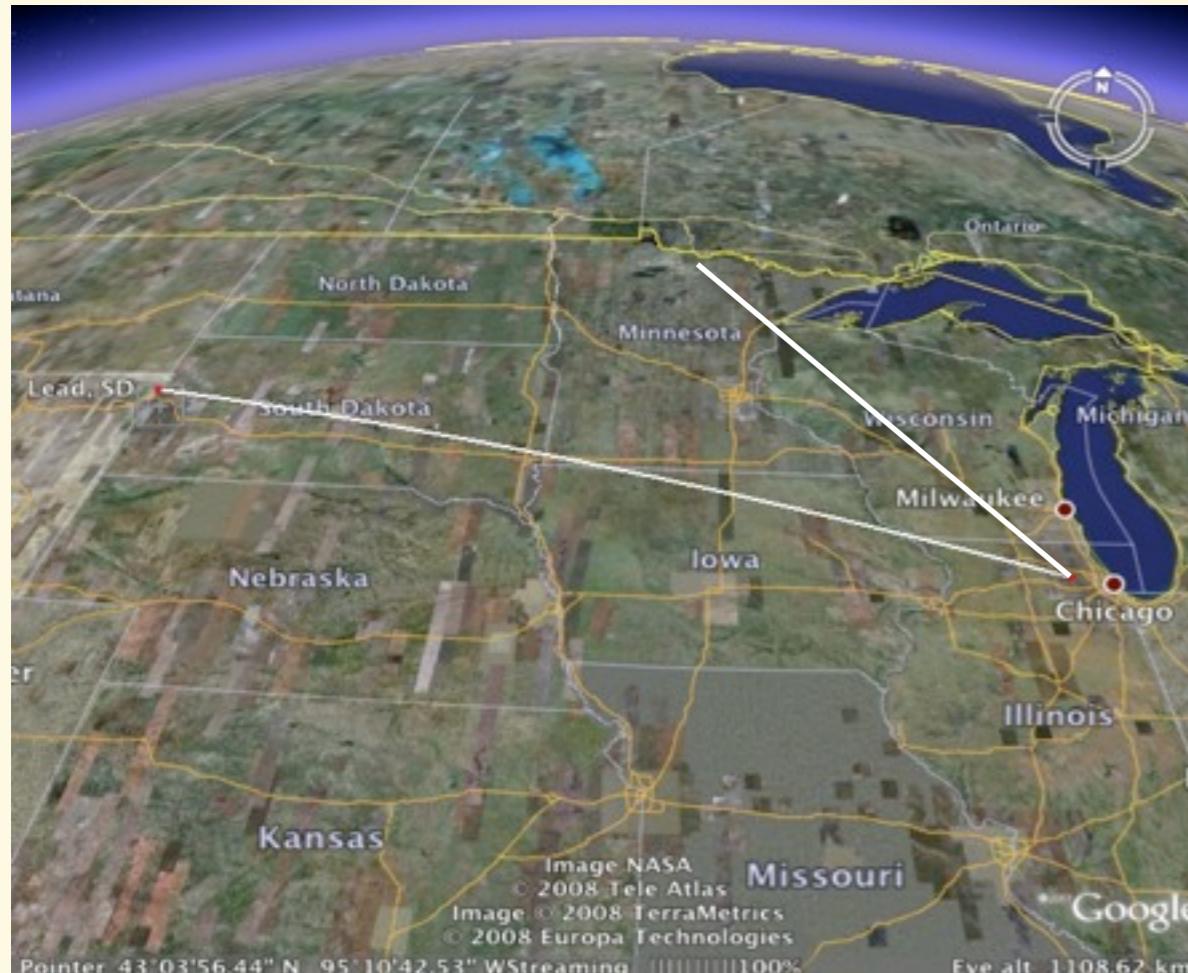

But a hypothesized *neutrino* CP violation can do so.

CP violation in *light-neutrino* oscillation would establish leptonic CP violation, and make leptogenesis more plausible.

# Geography

NuMI and LBNE

Project X

LBNE: New beamline  
Use of recycler

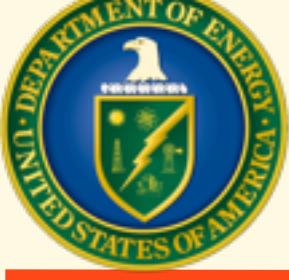

Project X: x3 Intensity  
New Injector

# LBNE Experiment

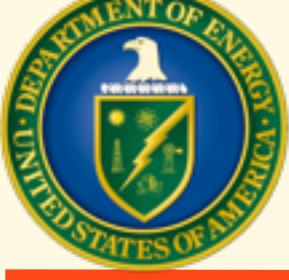

- Next generation neutrino experiments will require large number of events
- This is true for CP investigation even if  $\sin^2 2\theta_{13}$  relatively large
- $N_{\text{evt}} = \sigma \times \text{flux} \times \text{efficiency} \times \text{mass} \times \text{time}$ 
  - flux - from 700 kW proton beam
  - time - 5 yrs with neutrinos, 5 yrs with antineutrinos
  - mass - 100-200 kt Water Cerenkov (WC) or 17-34 kt LAr
  - efficiency - LAr ~6 times better for  $\nu_e$  channel at ~3GeV
- We are already pushing the limits

## Typical LBNE Sensitivity

1300km, 5yr  $\nu$ , 5yr  $\bar{\nu}$ -bar, 700kW, 40kT  $\epsilon=1$ .

Solid: normal hierarchy; dashed: inverted  
Ideal detector assumed in all cases  
**Error bars indicate  $3\sigma$** ; statistics only

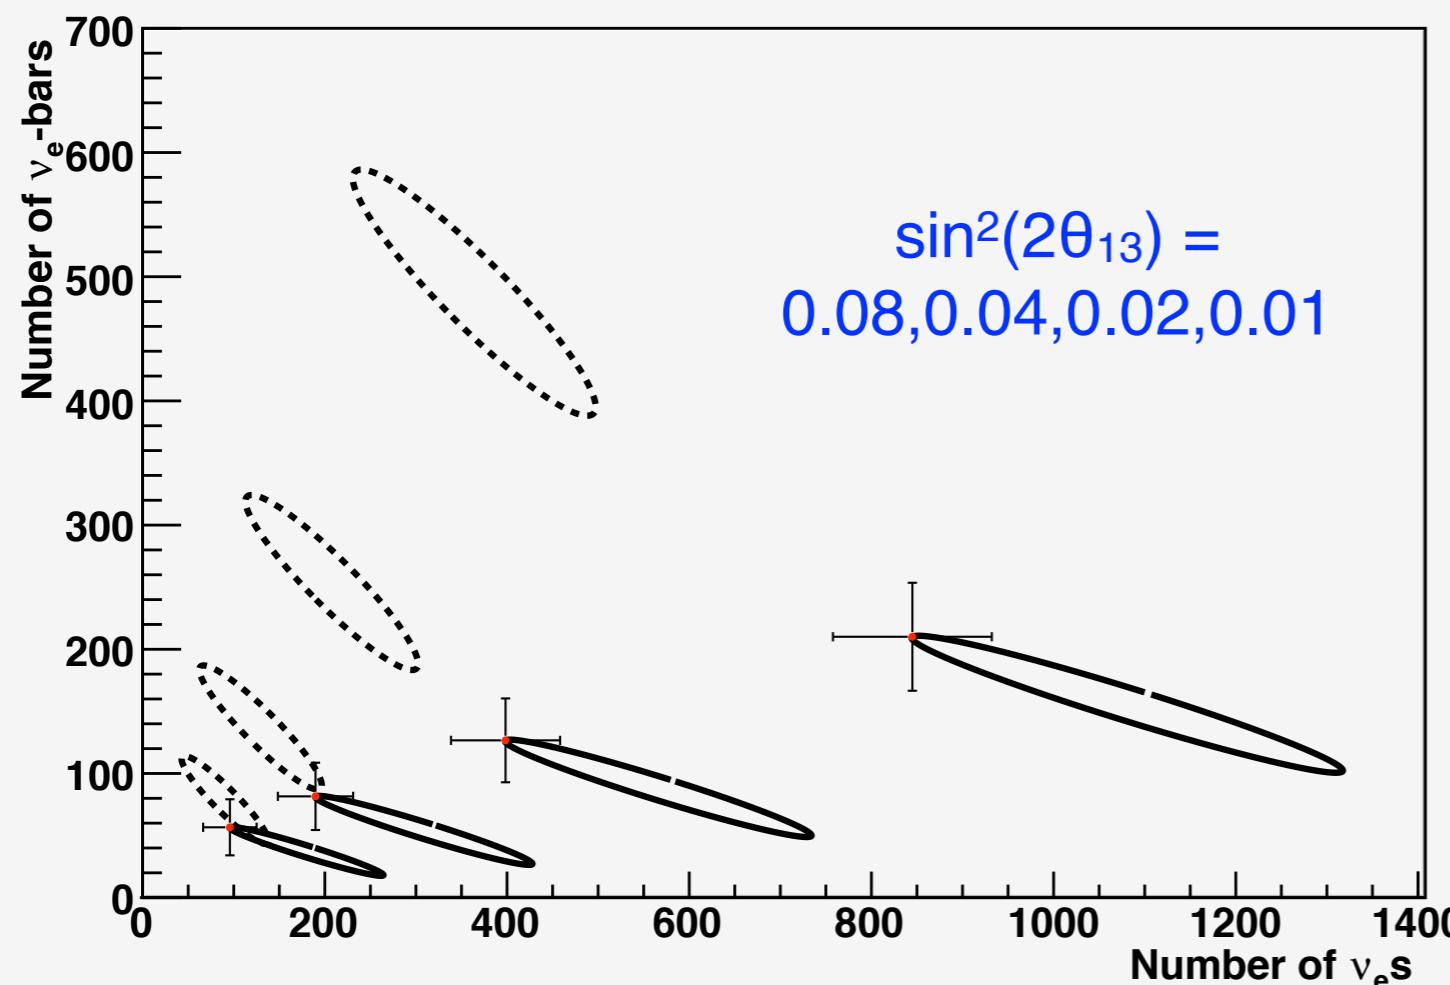

# Graphical Representation

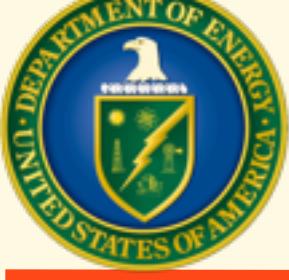

## Typical LBNE Sensitivity

1300km, 5yr  $\nu$ , 5yr  $\bar{\nu}$ -bar, 700kW, 40kT  $\epsilon=1$ .

- As  $\theta_{13}$  increases ellipses move out
- As  $\theta_{13}$  decreases, the two sets of ellipses become less separated
- The statistical significance of CP violation is independent of the value of  $\sin^2(2\theta_{13})$
- But for low values of  $\sin^2(2\theta_{13})$  there is ambiguity between hierarchy and  $\delta_{CP}$

# Fitting for 3 Parameters

# Fitting for 3 Parameters

- One fits the energy spectra for  $\nu_\mu \rightarrow \nu_e$  for:
  - $\sin^2(2\theta_{13})$
  - mass hierarchy
  - CP violation phase  $\delta_{CP}$

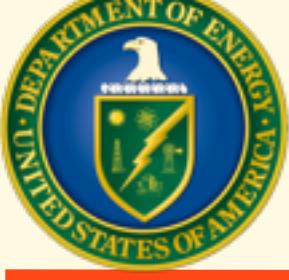

# Fitting for 3 Parameters

- One fits the energy spectra for  $\nu_\mu \rightarrow \nu_e$  for:
  - $\sin^2(2\theta_{13})$
  - mass hierarchy
  - CP violation phase  $\delta_{CP}$
- The other oscillation parameters ( $\theta_{12}$ ,  $\theta_{23}$ ,  $\Delta m^2_{12}$ ,  $\Delta m^2_{23}$ ) are kept constant at their best measured values

# Fitting for 3 Parameters

- One fits the energy spectra for  $\nu_\mu \rightarrow \nu_e$  for:
  - $\sin^2(2\theta_{13})$
  - mass hierarchy
  - CP violation phase  $\delta_{CP}$
- The other oscillation parameters ( $\theta_{12}$ ,  $\theta_{23}$ ,  $\Delta m^2_{12}$ ,  $\Delta m^2_{23}$ ) are kept constant at their best measured values
- Later on one might be able to add additional constraints, eg value of  $\theta_{13}$  from reactors or from NOvA or T2K

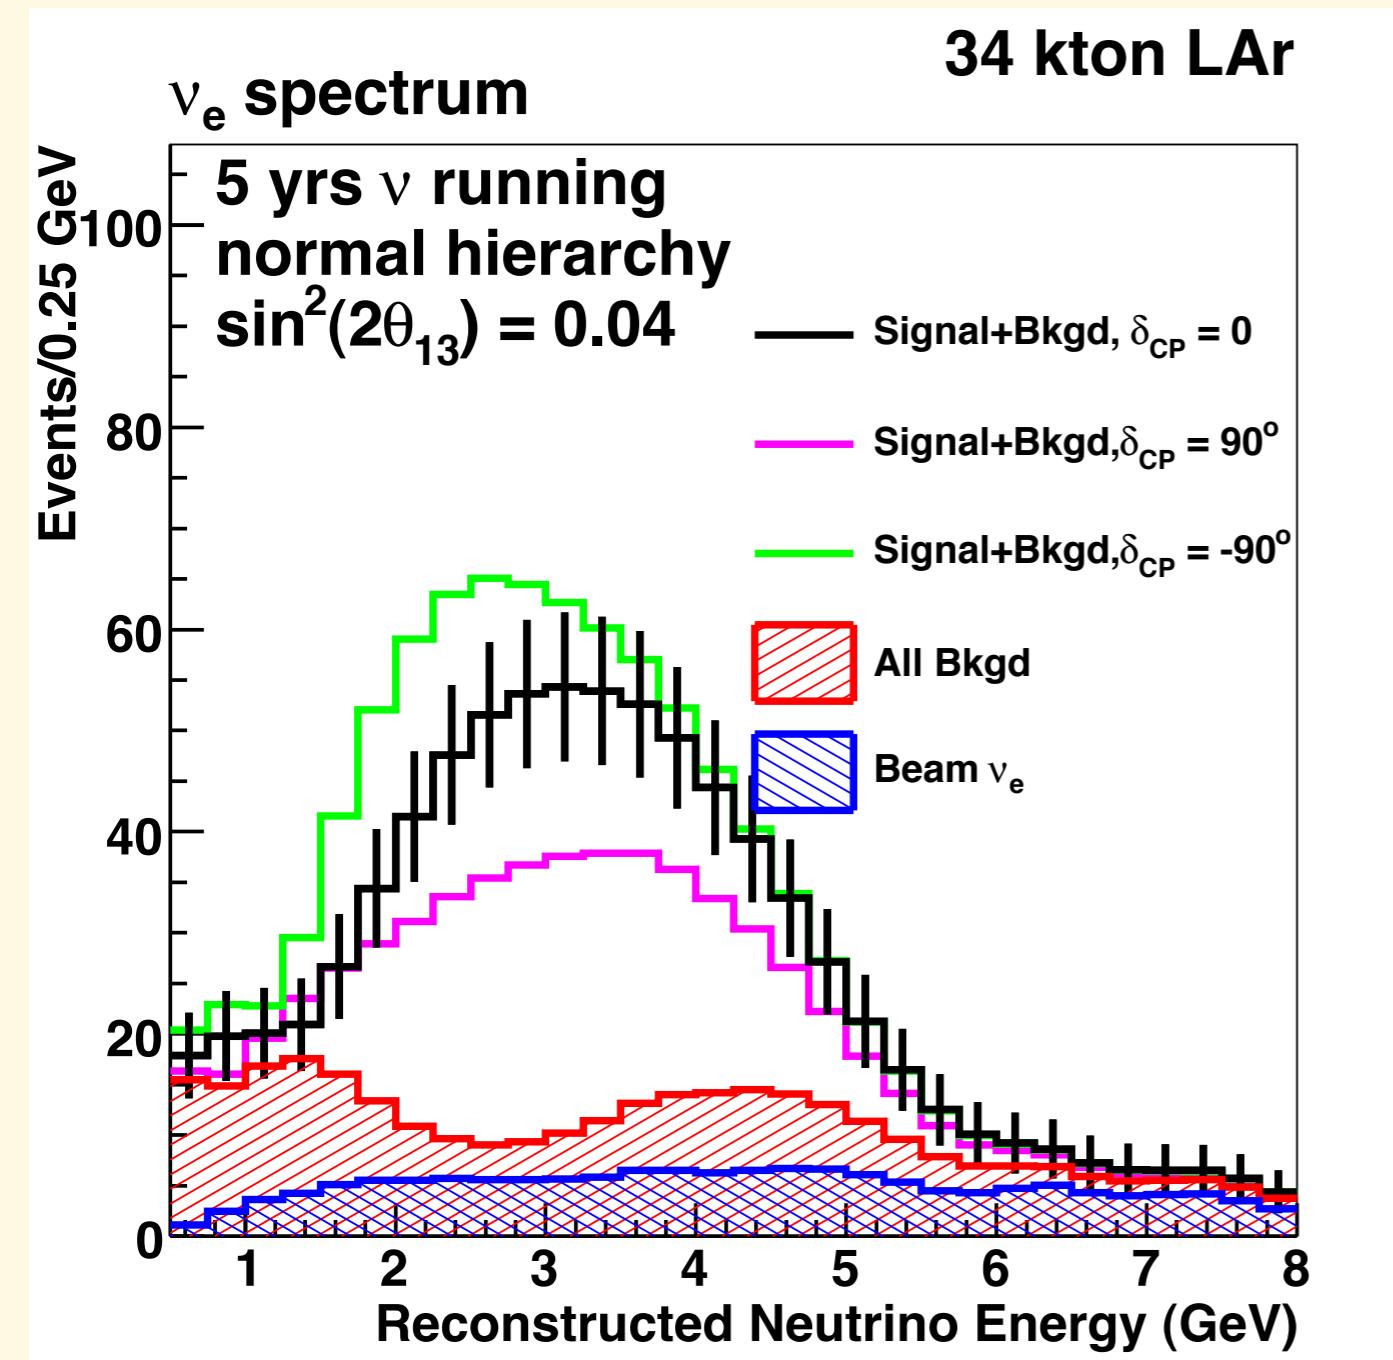

# Energy Spectra (700kW)

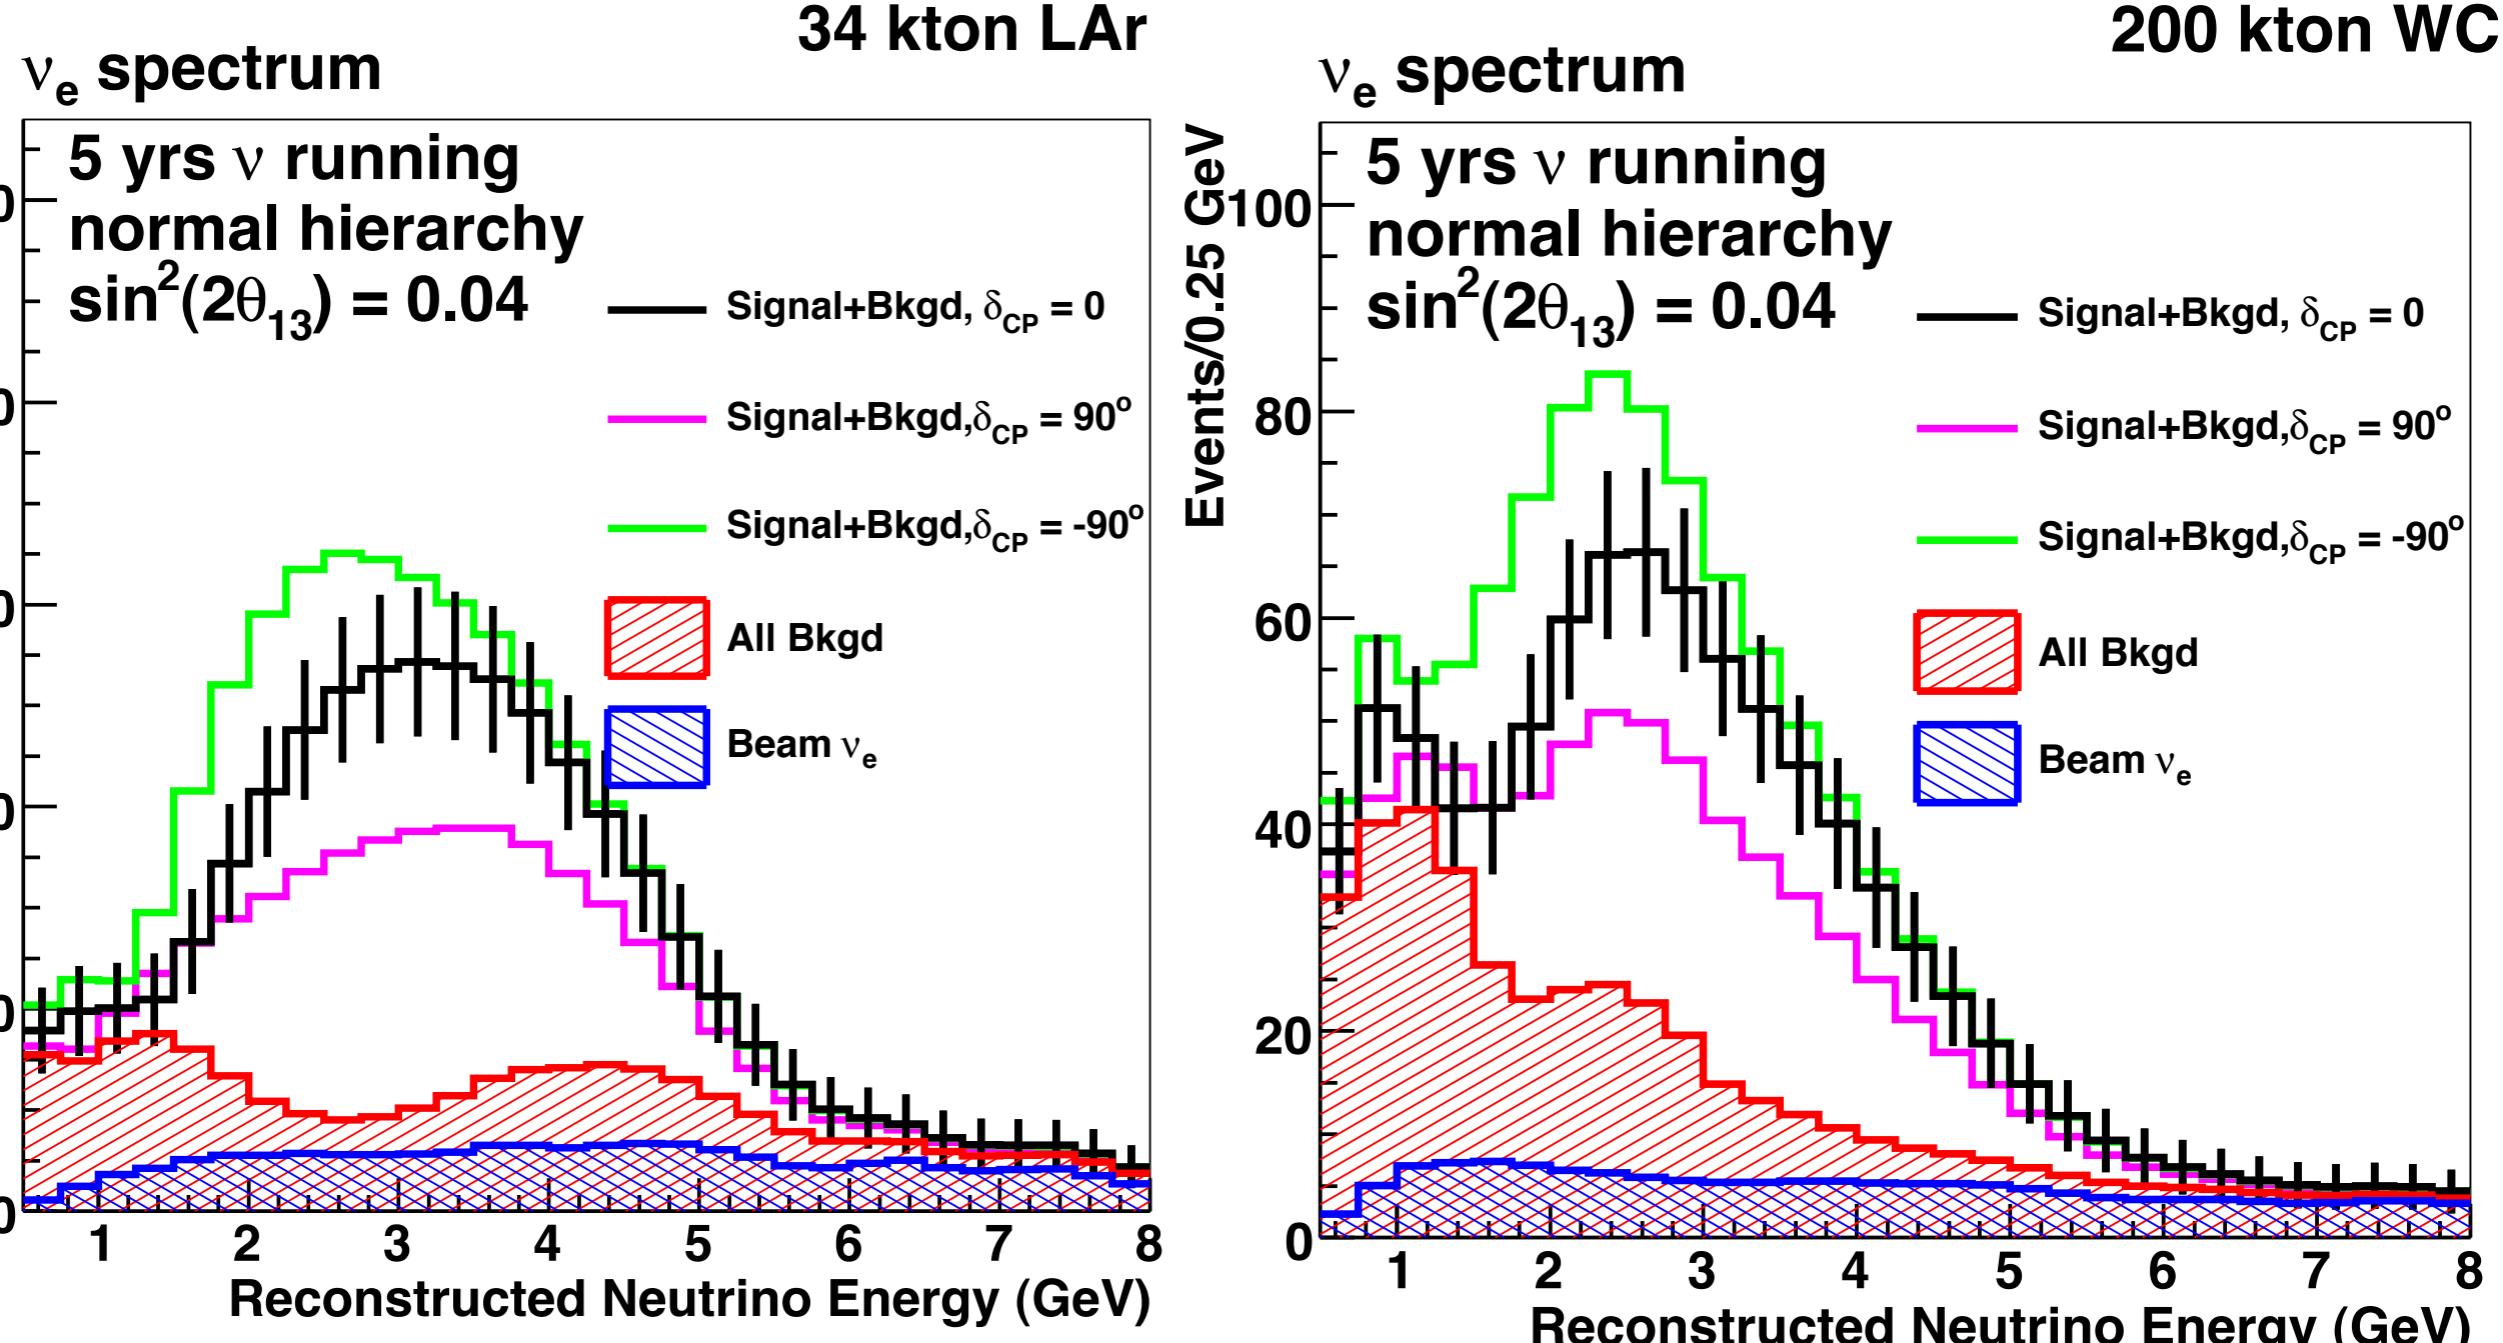

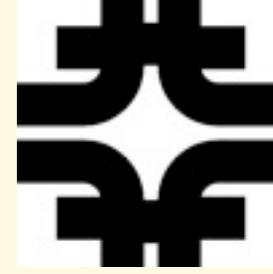

# Energy Spectra (700kW)

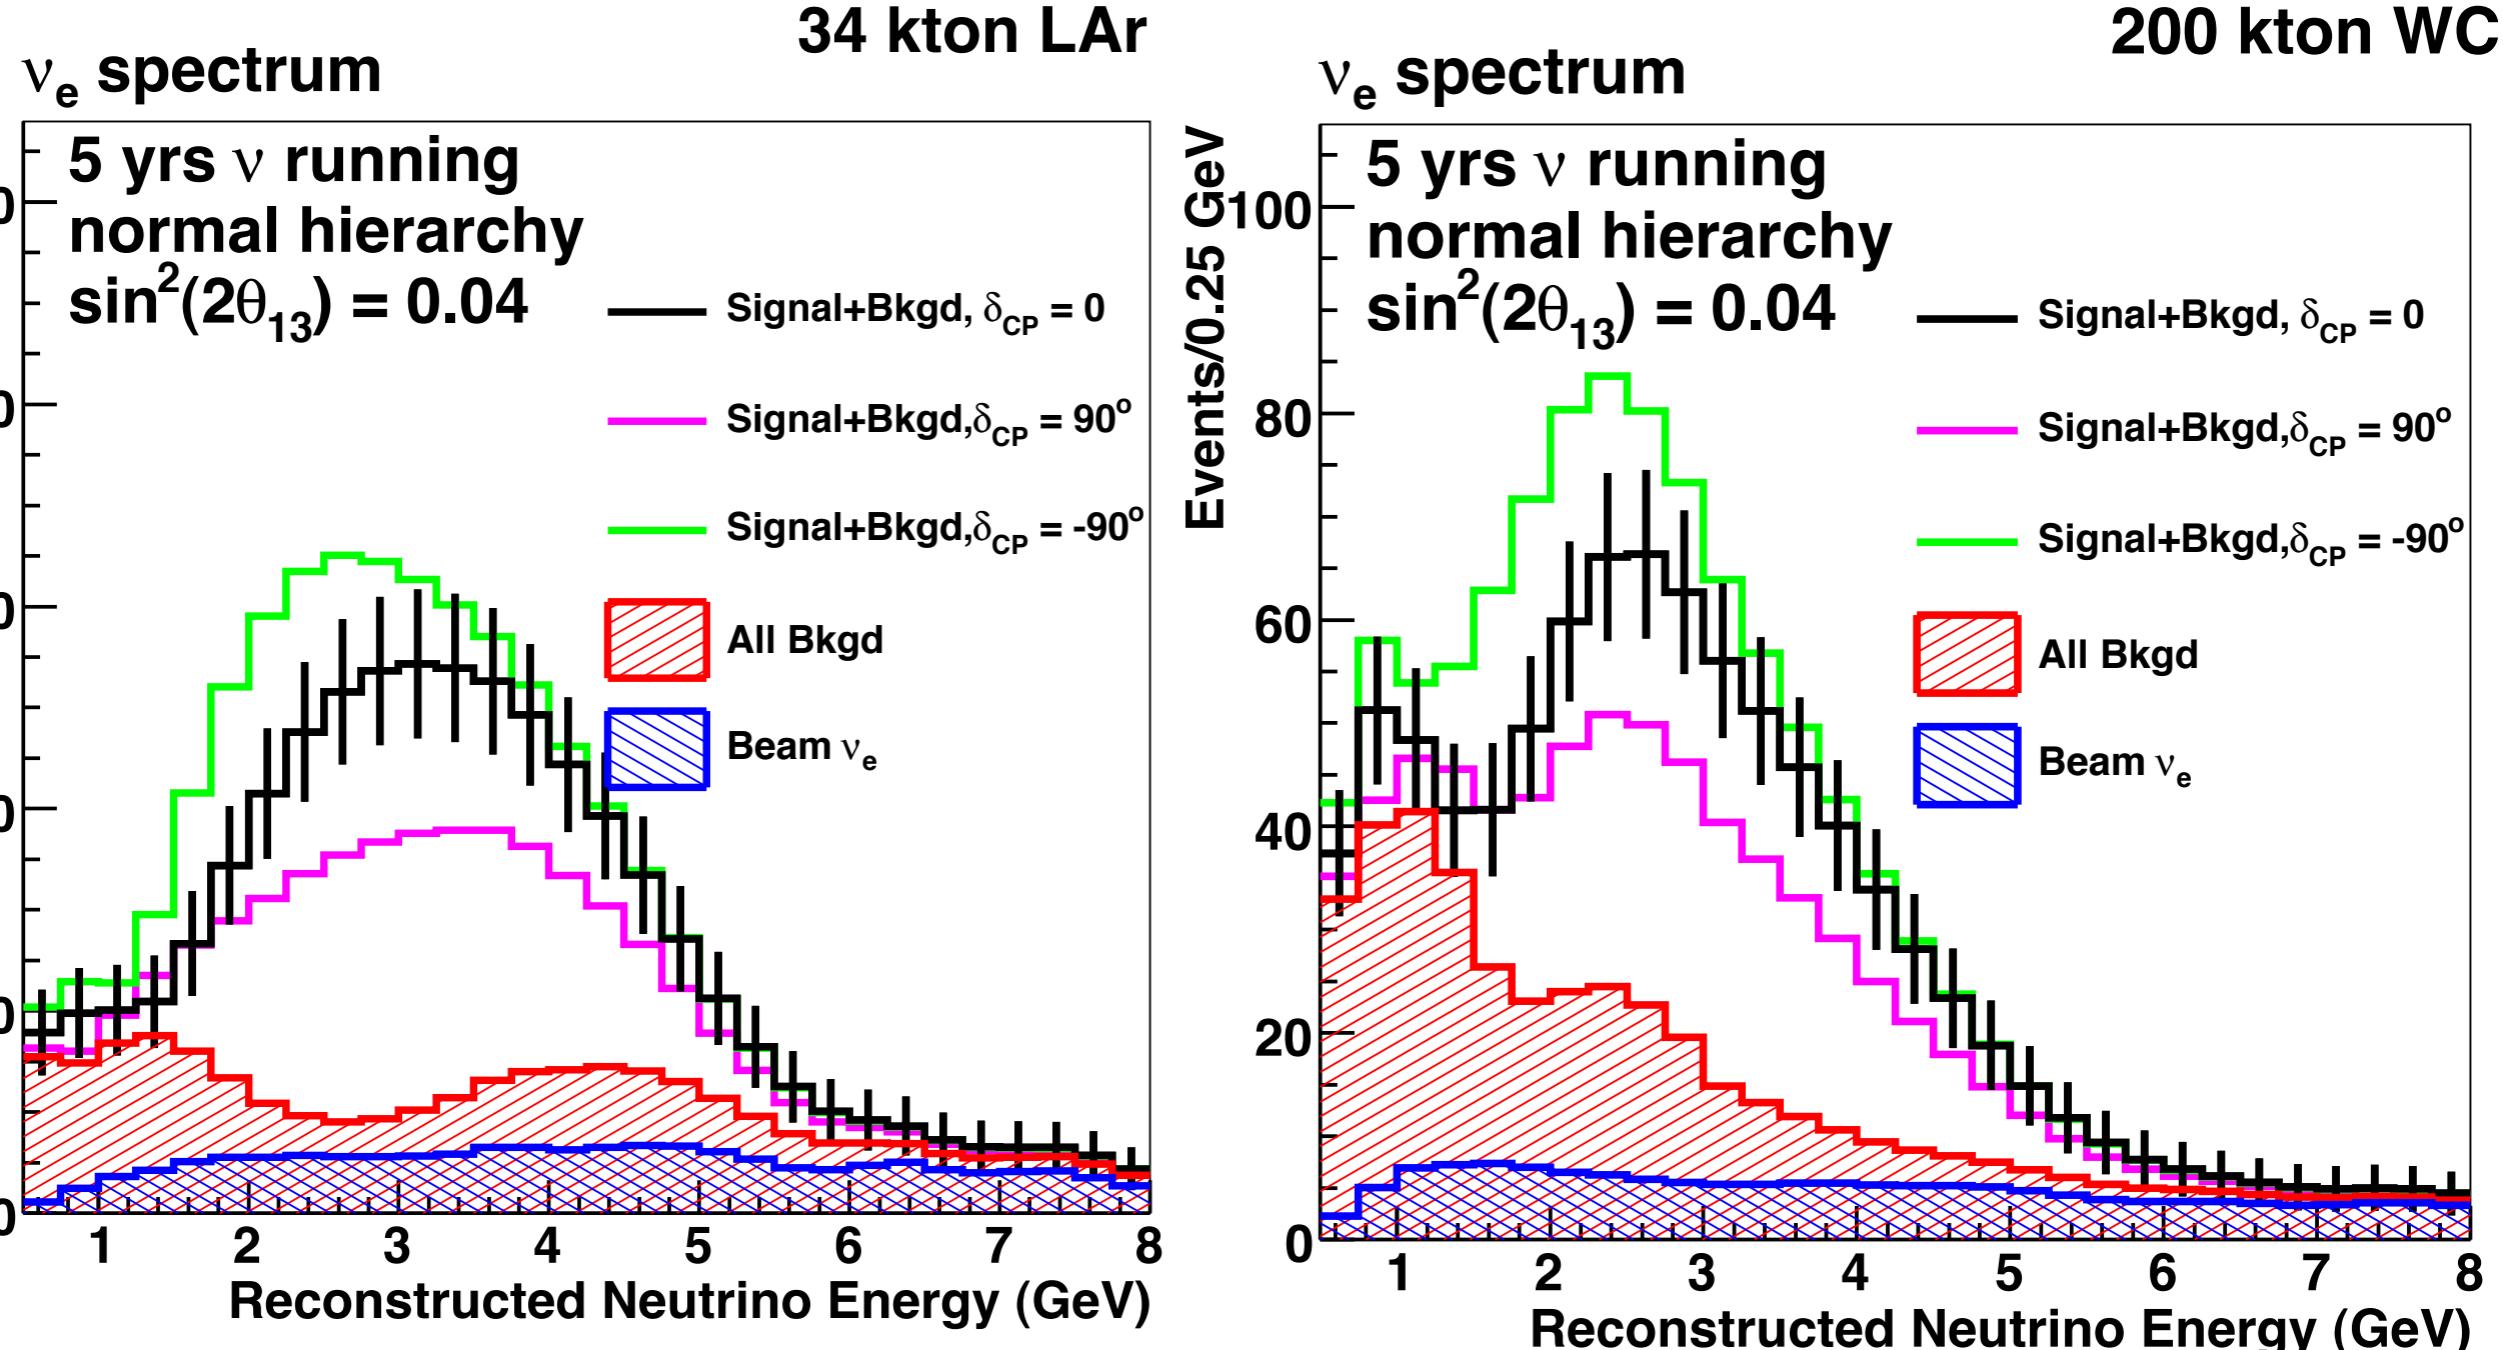

# Energy Spectra (700kW)

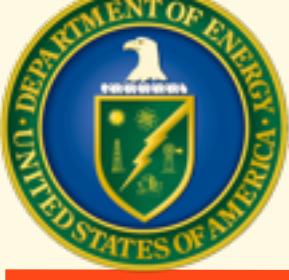

# Energy Spectra (700kW)

1 kt of LAr gives comparable sensitivity as 6 kt of H<sub>2</sub>O  
mainly due to reduction of NC background

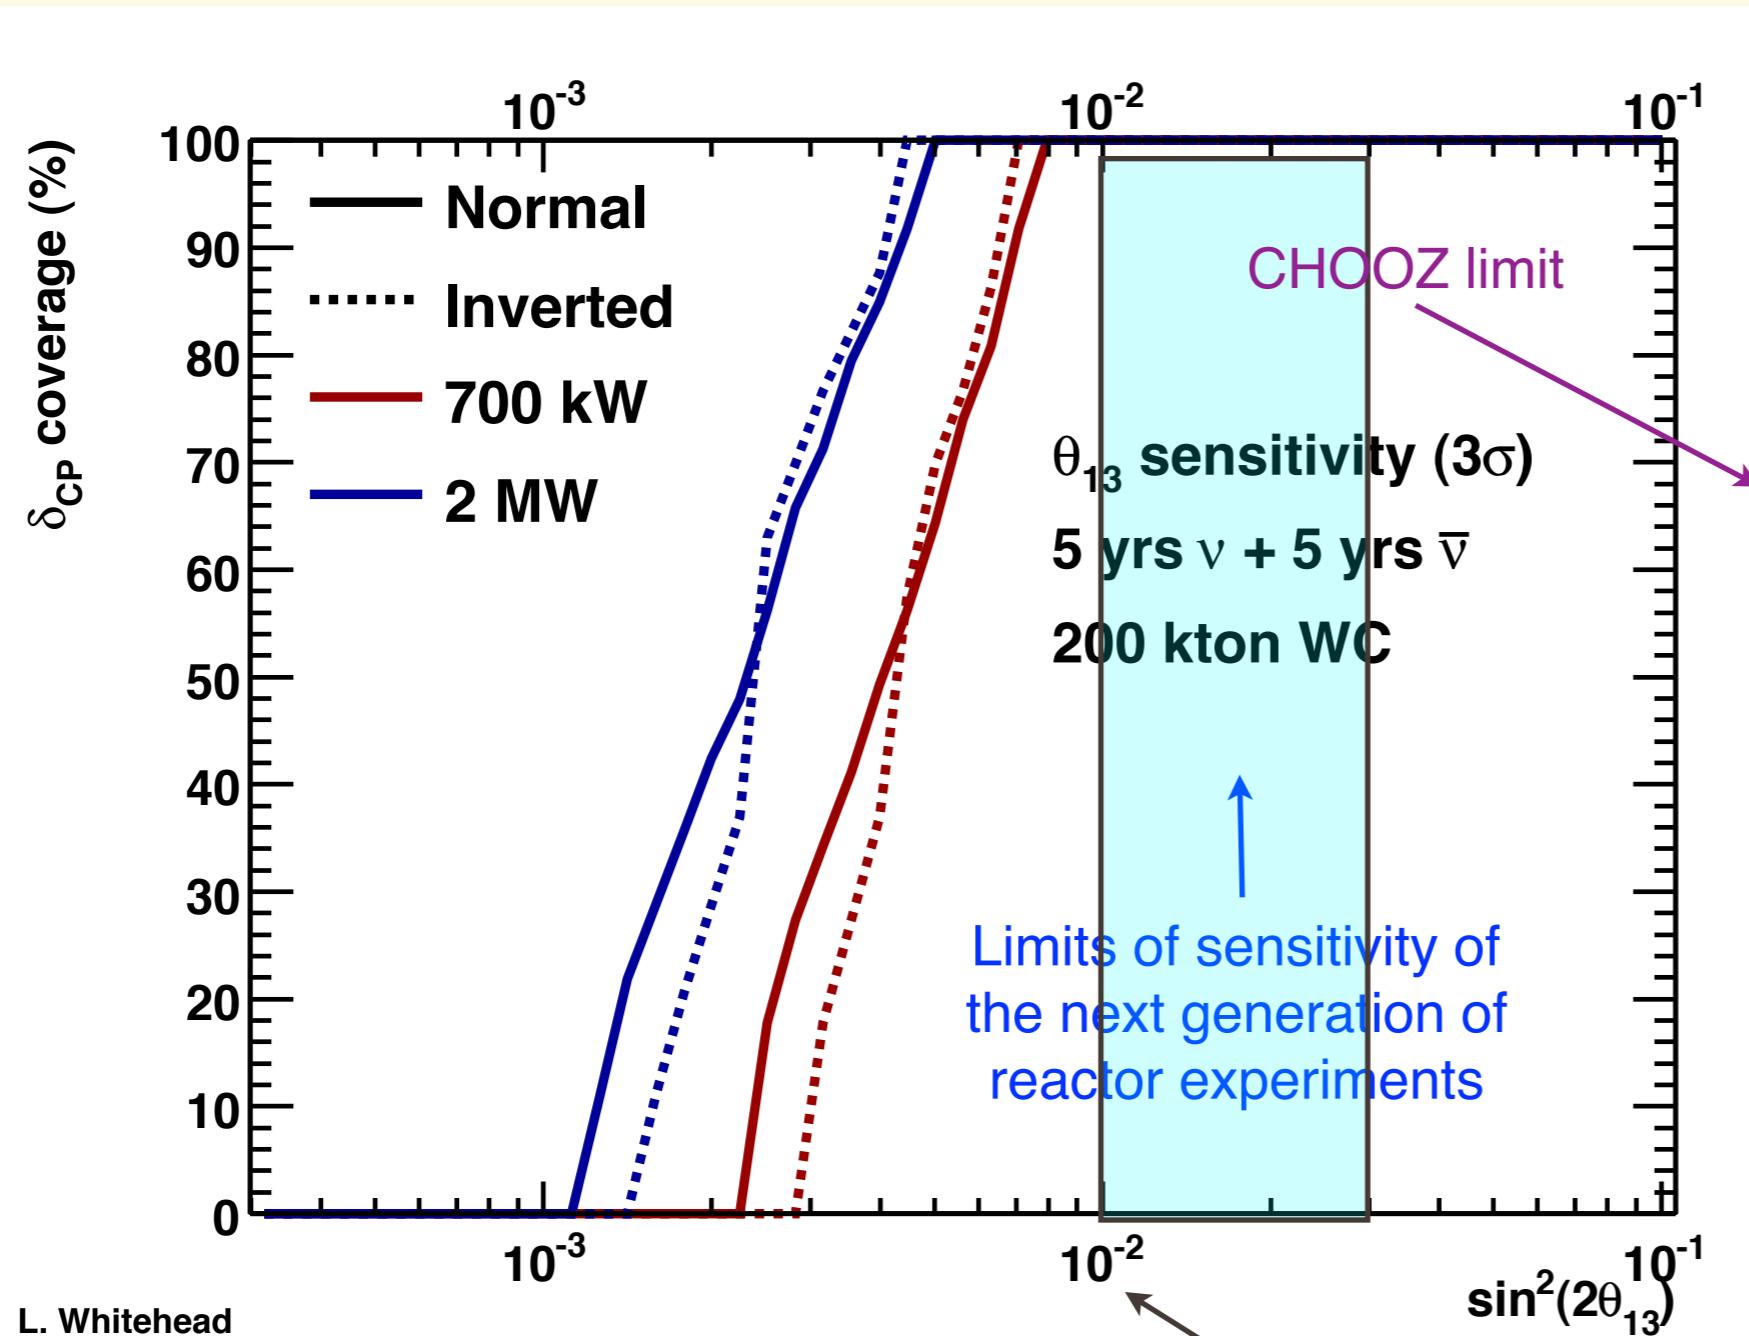

# Sensitivity for $\sin^2(2\theta_{13})$

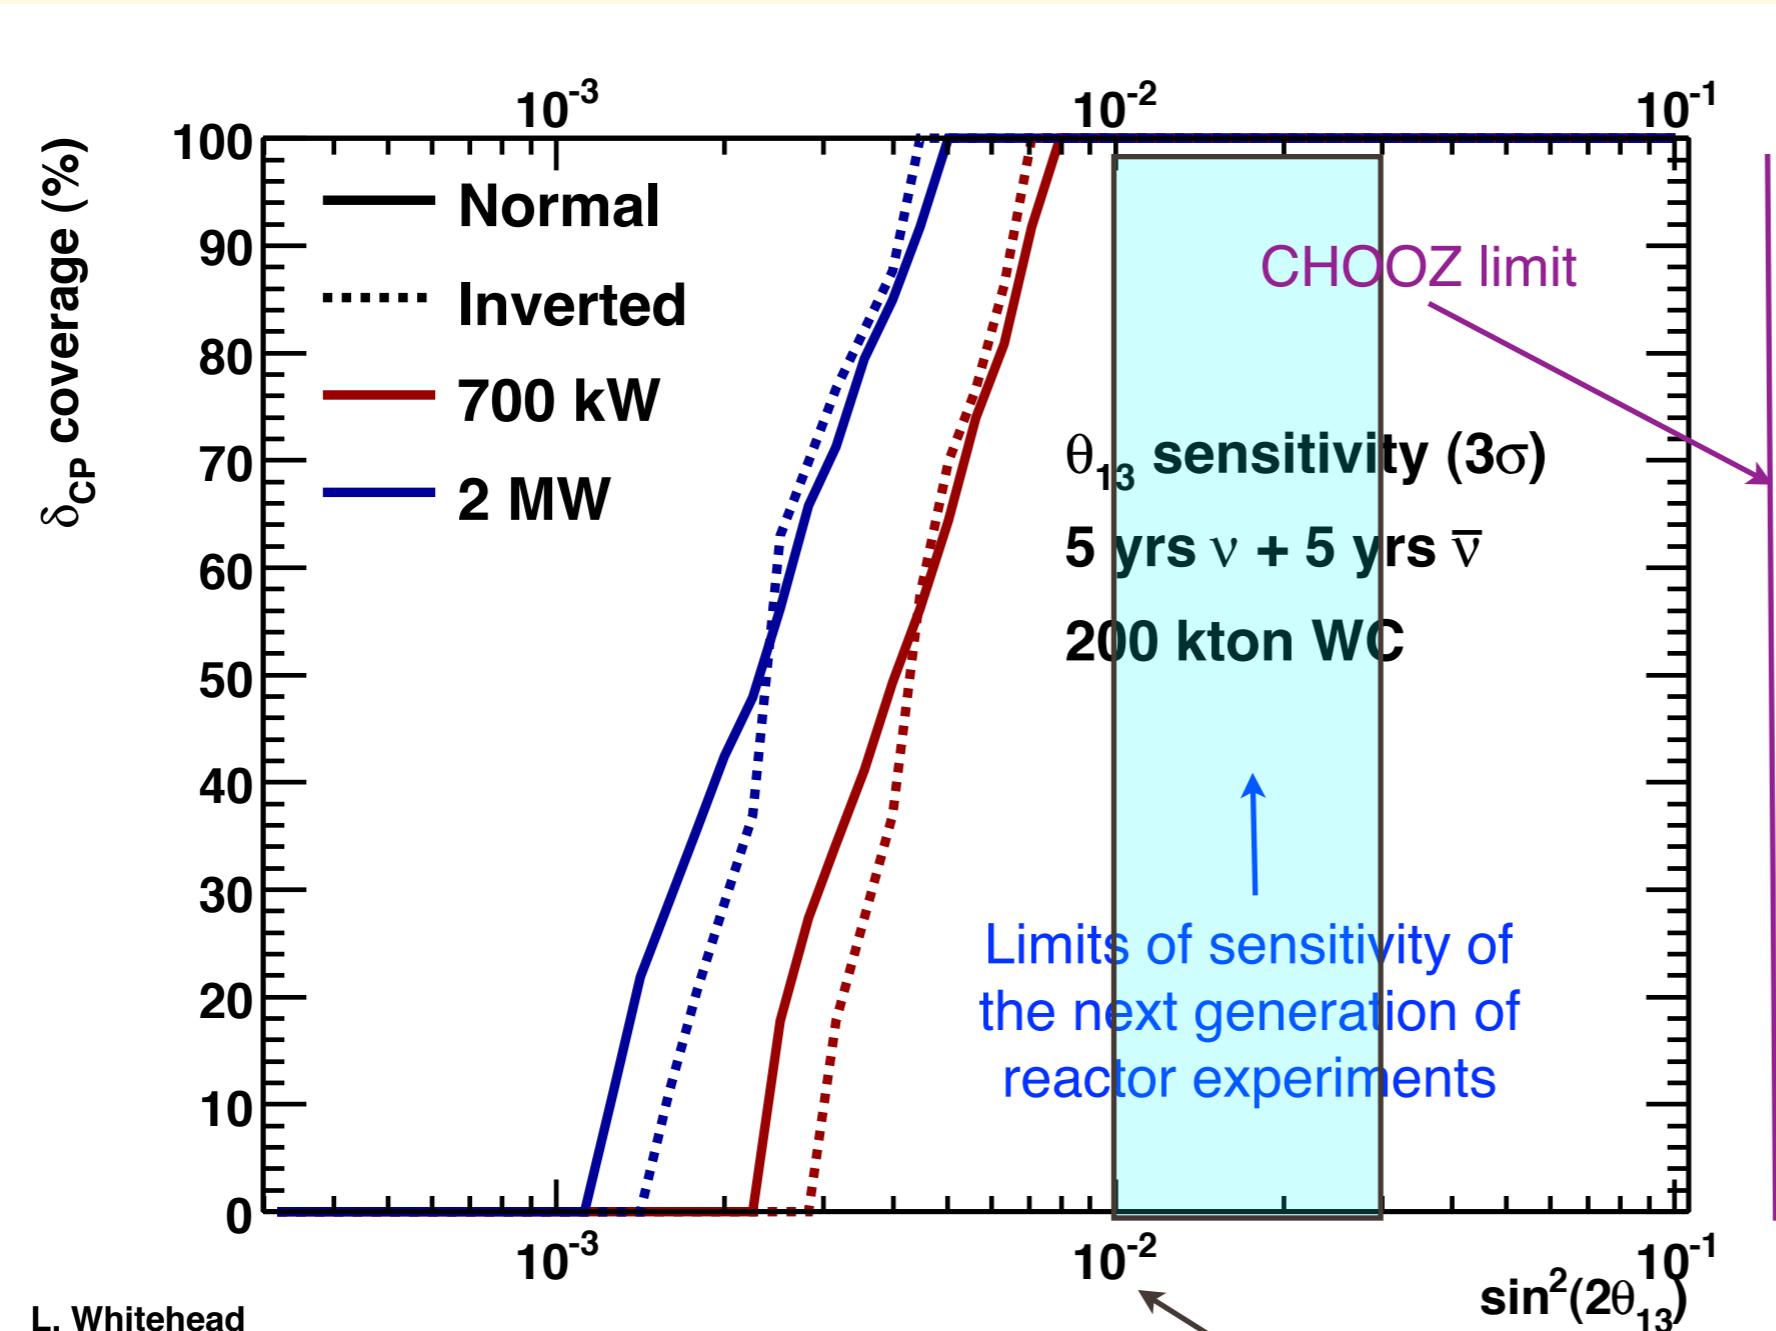

# Sensitivity for $\sin^2(2\theta_{13})$

Sensitivity of NOvA  
and T2K “wiggles”  
around this value

# Sensitivity for $\sin^2(2\theta_{13})$

Sensitivity of NOvA  
and T2K "wiggles"  
around this value

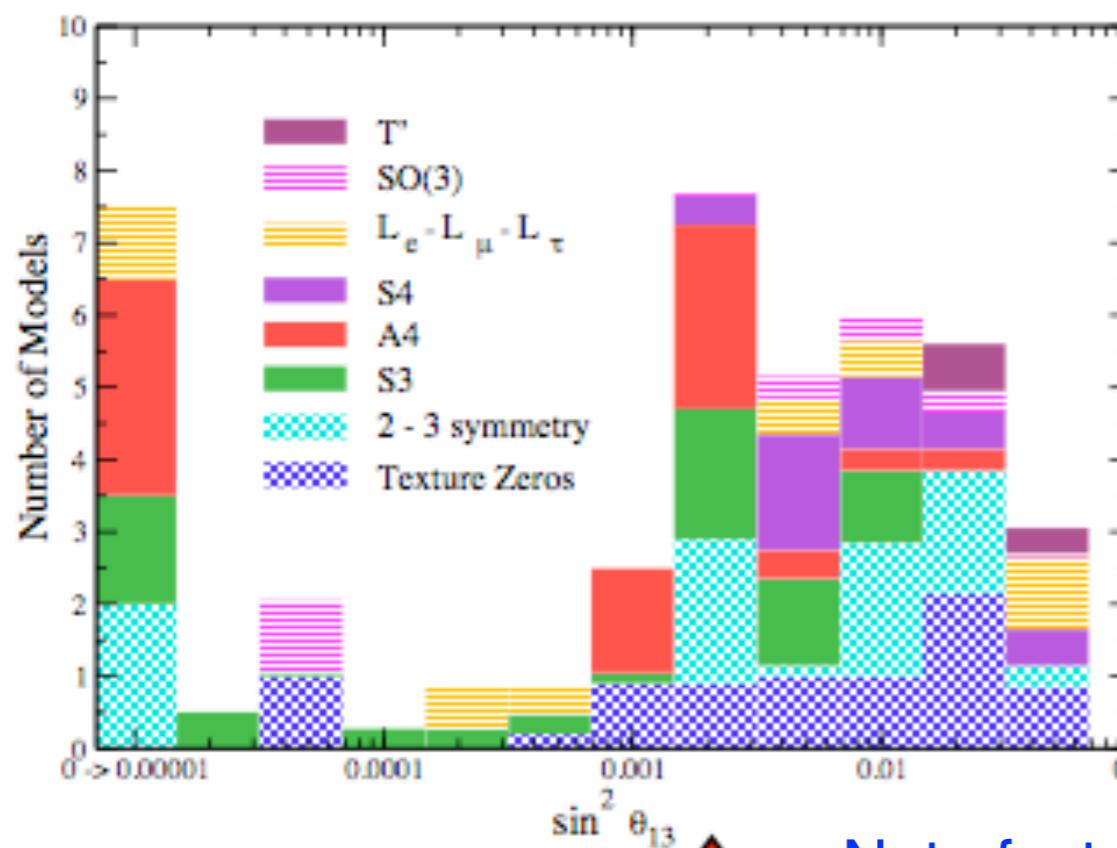

- Project X can extend  $\sin^2(2\theta_{13})$  reach by  $\sim 2$
- This will address predictions of a number of models

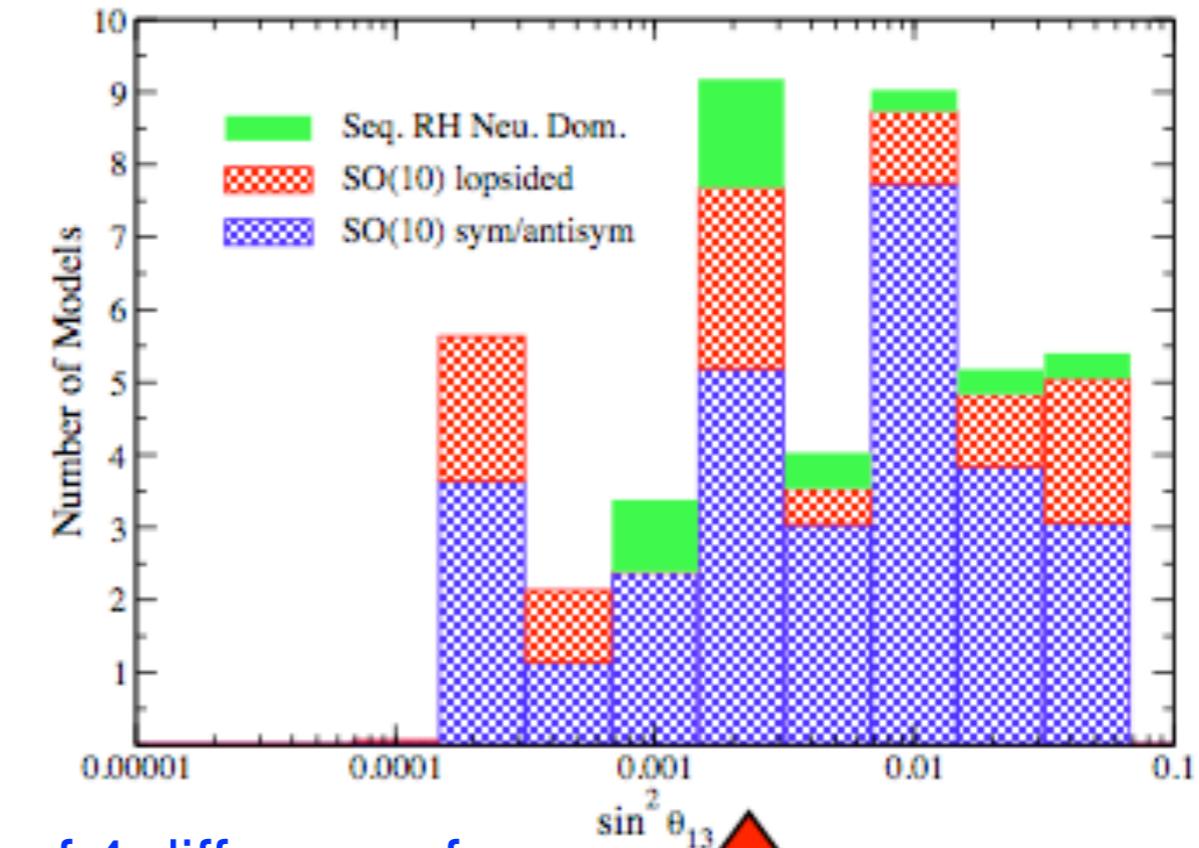

# Theoretical Predictions

Predictions of Lepton Flavor Models

Predictions of Grand Unified Models

Note factor of 4 difference from previous plot in horizontal scale

How do we distinguish Models with the same  $\sin^2 \theta_{13}$ ?

By relationships with other parameters:

$$\text{e.g. } \theta_{12} - \theta_{13} \cos(\delta) = \sqrt{1/3}$$

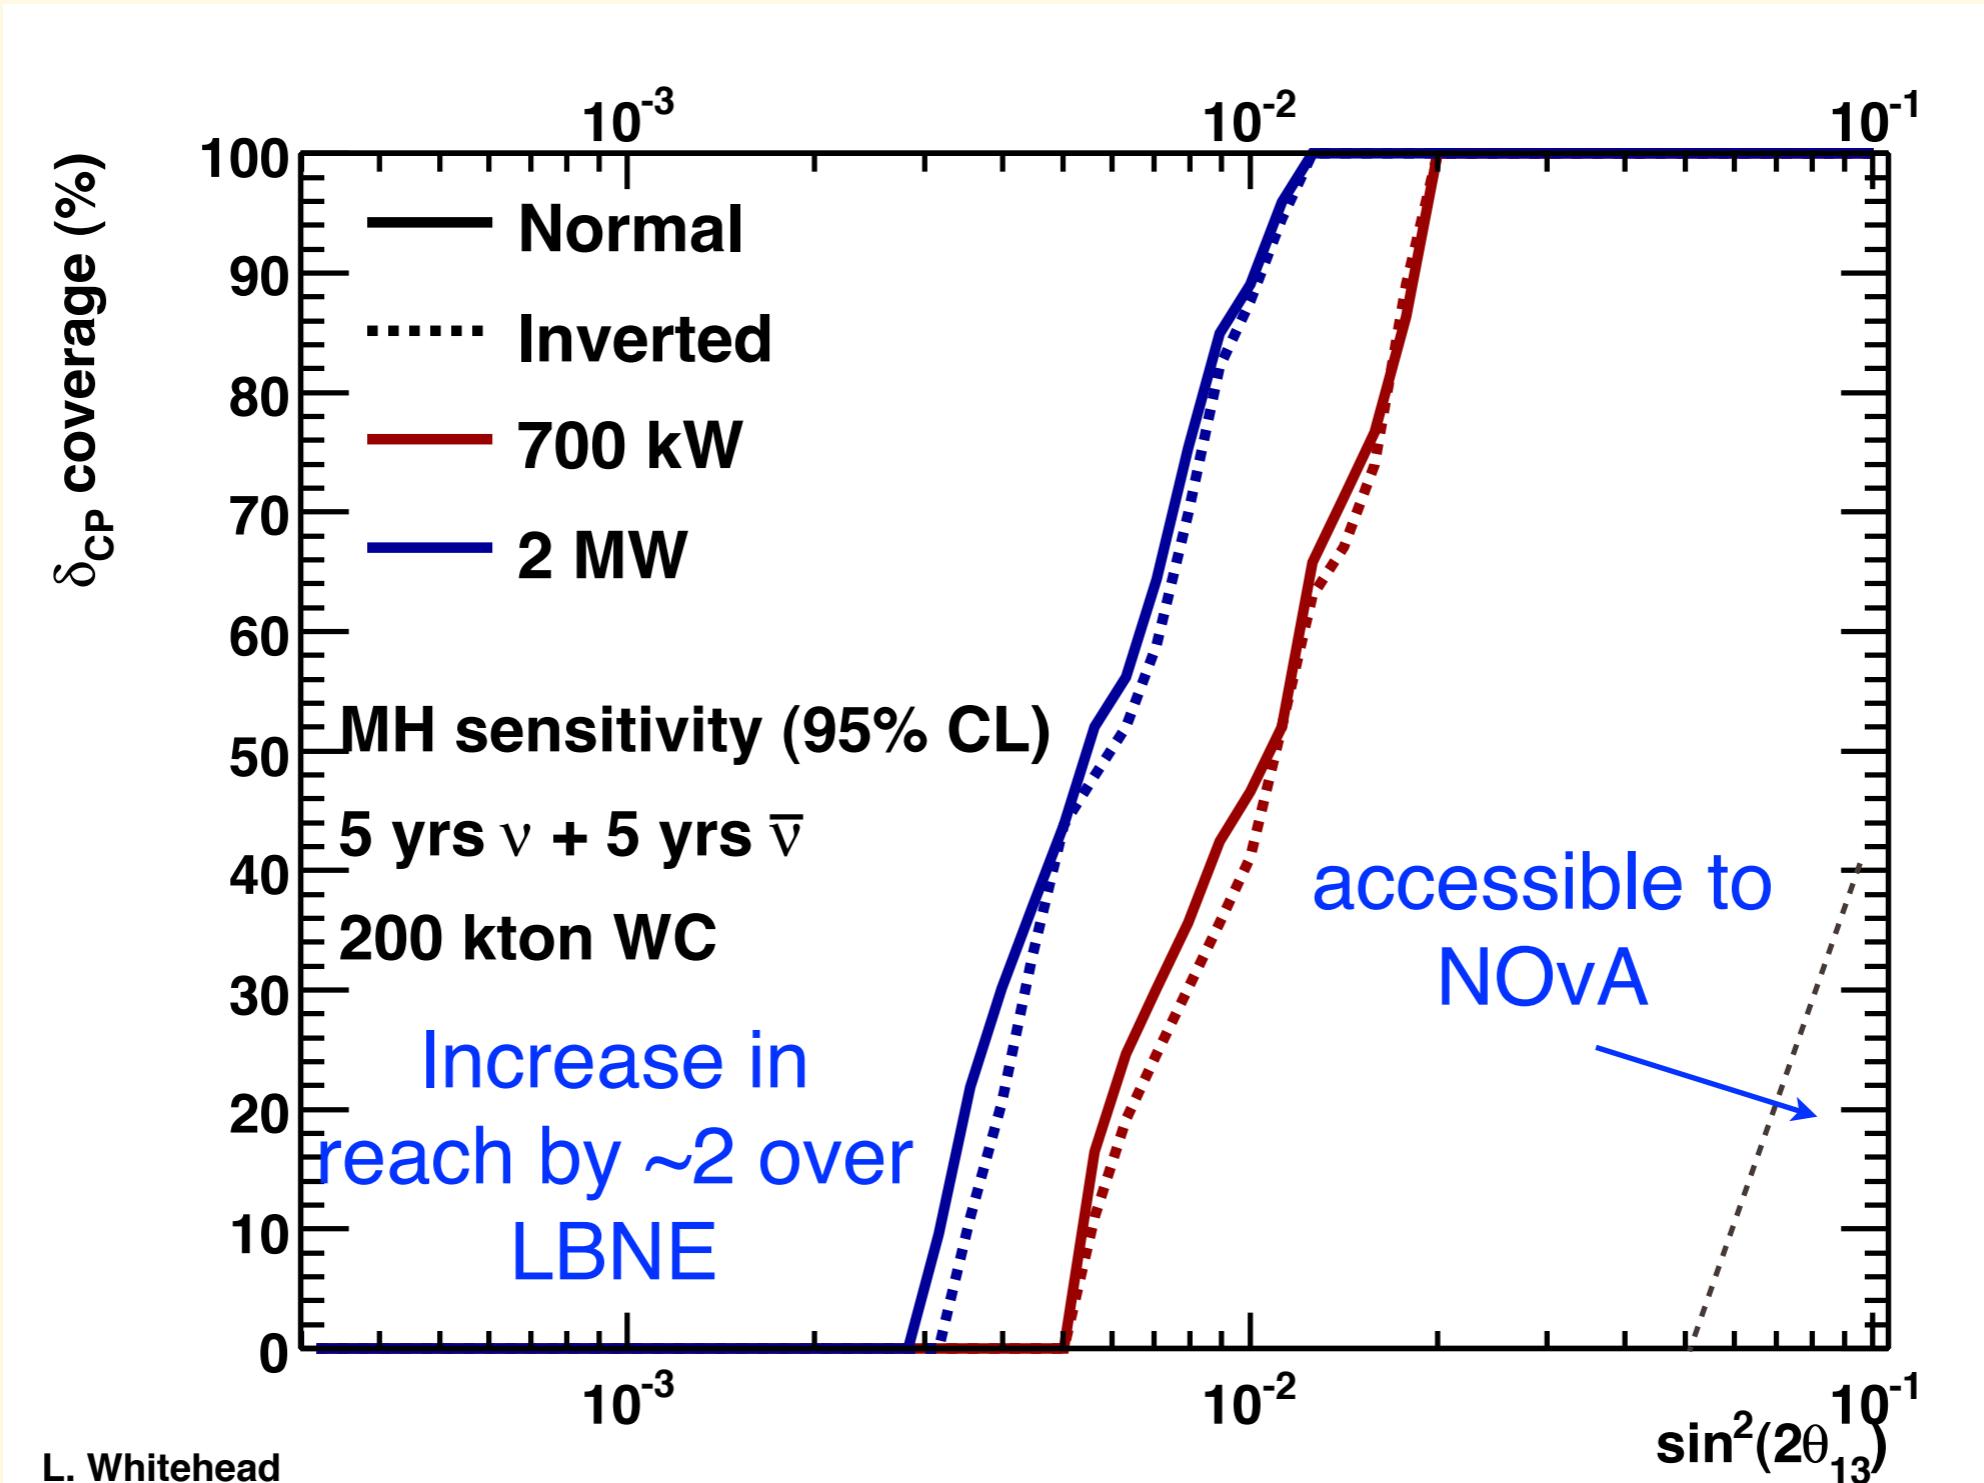

but there are many such examples.

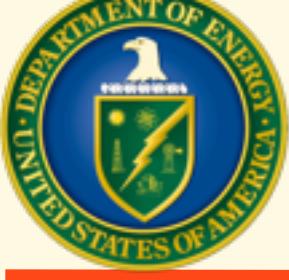

This will require precision measurements of

$$\sin^2 \theta_{13}, \sin^2 \theta_{12}, \sin^2 \theta_{23} \text{ and } \delta_{CP}$$

# Sensitivity for Mass Hierarchy

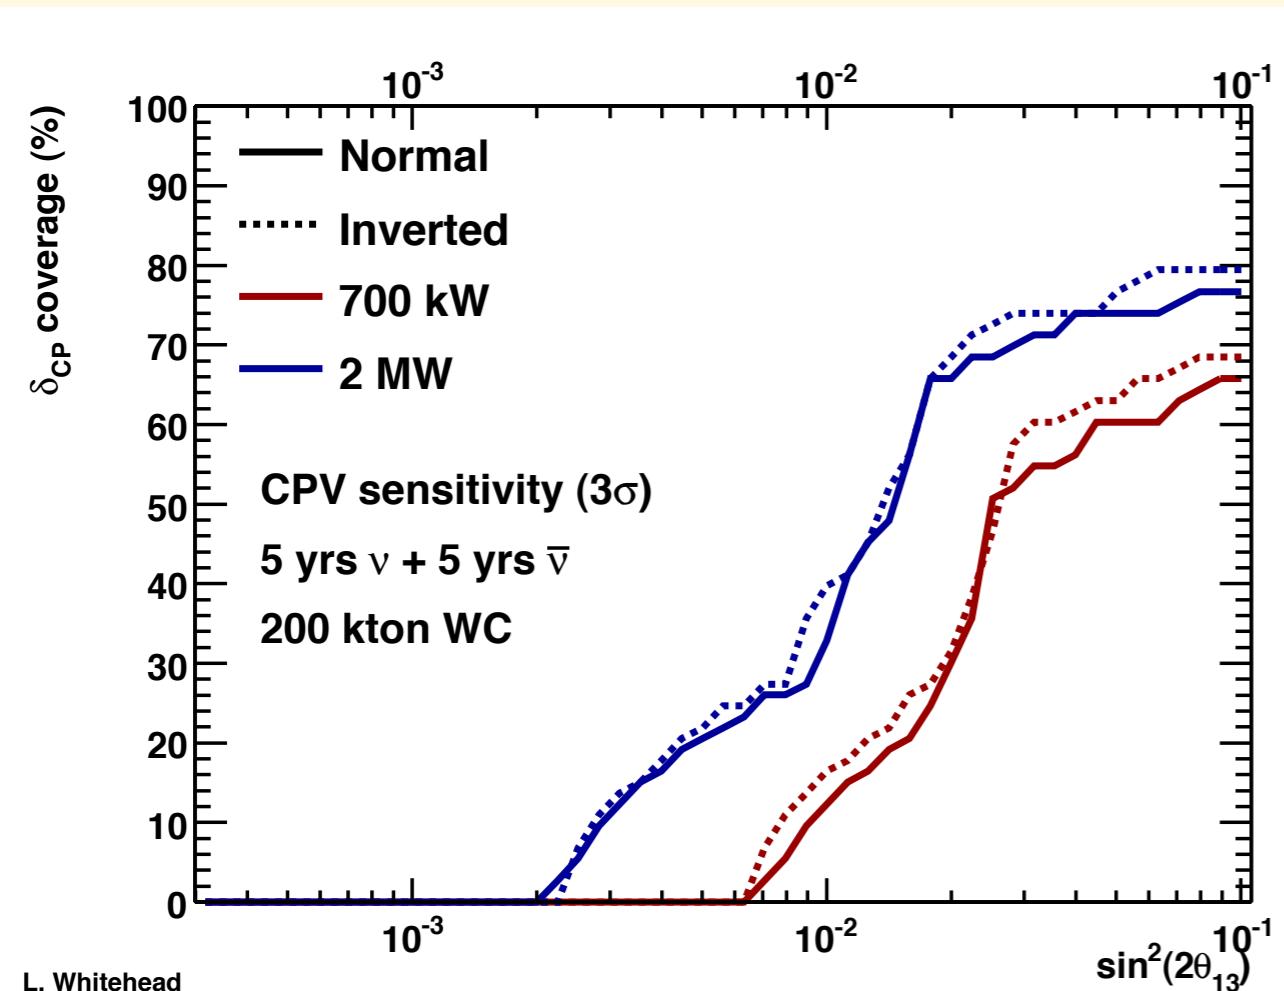

# CP Violation Sensitivity

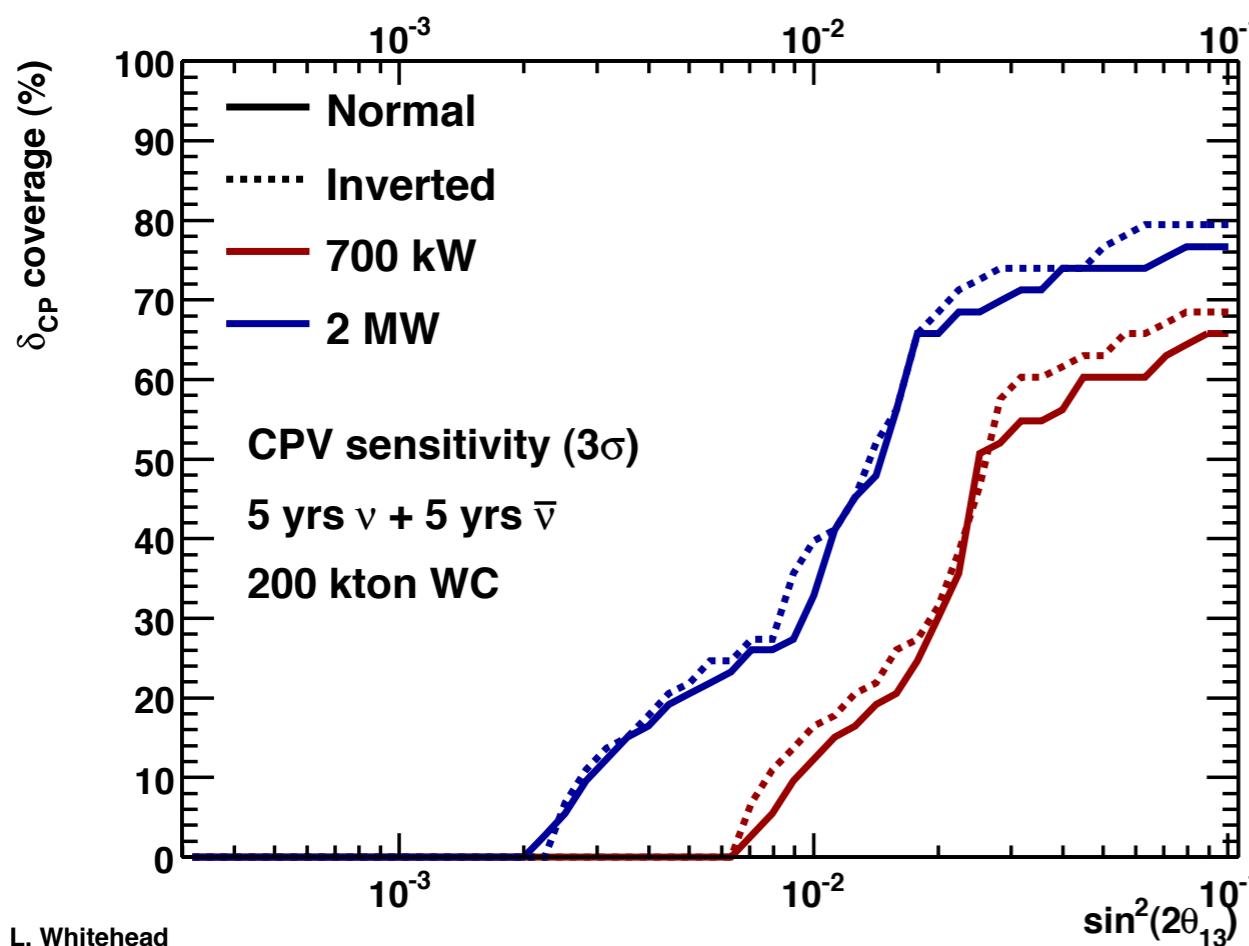

# CP Violation Sensitivity

Increase in  $\delta_{\text{CP}}$   
coverage by 2-2.5  
over LBNE coverage

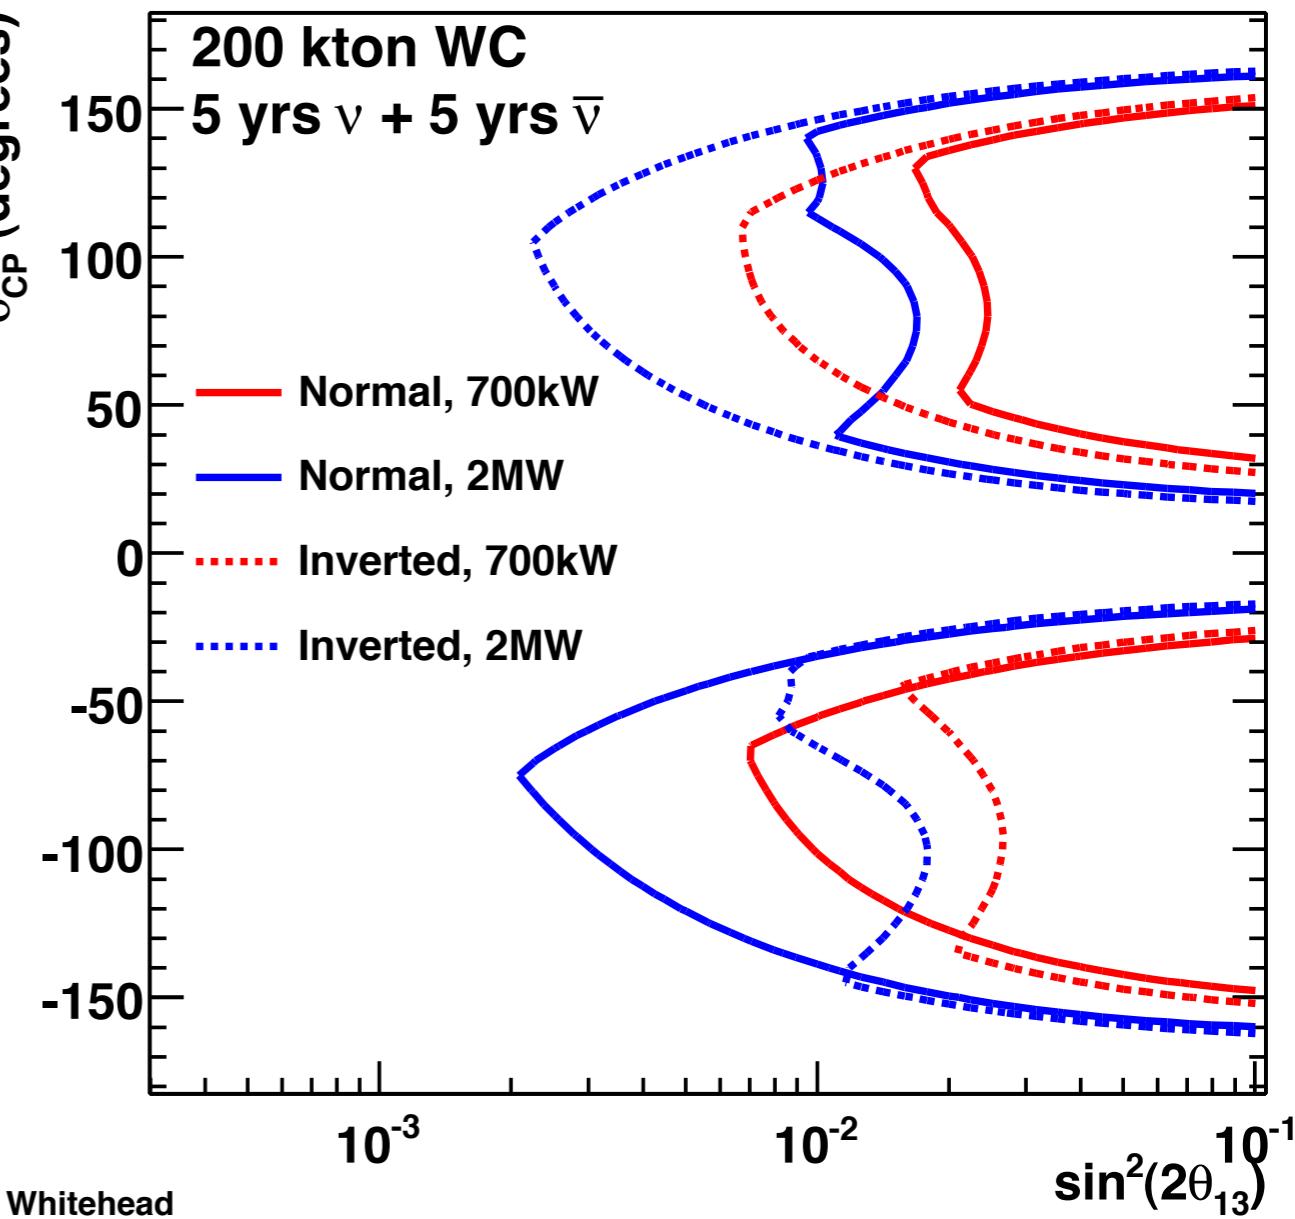

# CP Violation Sensitivity

L. Whitehead

Increase in  $\delta_{CP}$   
coverage by 2-2.5  
over LBNE coverage

## CPV Sensitivity (3σ)

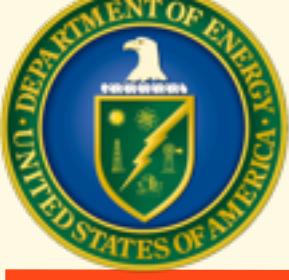

L. Whitehead

# CP/Hierarchy Ambiguity

# CP/Hierarchy Ambiguity

- For  $\sin^2(2\theta_{13}) > 0.03$  sensitivity to CP violation has only weak dependence on the values of  $\theta_{13}$

# CP/Hierarchy Ambiguity

- For  $\sin^2(2\theta_{13}) > 0.03$  sensitivity to CP violation has only weak dependence on the values of  $\theta_{13}$
- As seen earlier, for low values of  $\sin^2(2\theta_{13}) \sim < 0.03$ , the two ellipses in the DUSEL beam begin to overlap affecting CP and mass hierarchy determination

# CP/Hierarchy Ambiguity

- For  $\sin^2(2\theta_{13}) > 0.03$  sensitivity to CP violation has only weak dependence on the values of  $\theta_{13}$
- As seen earlier, for low values of  $\sin^2(2\theta_{13}) \sim < 0.03$ , the two ellipses in the DUSEL beam begin to overlap affecting CP and mass hierarchy determination
- Resolving this ambiguity is a significant experimental challenge

# CP/Hierarchy Ambiguity

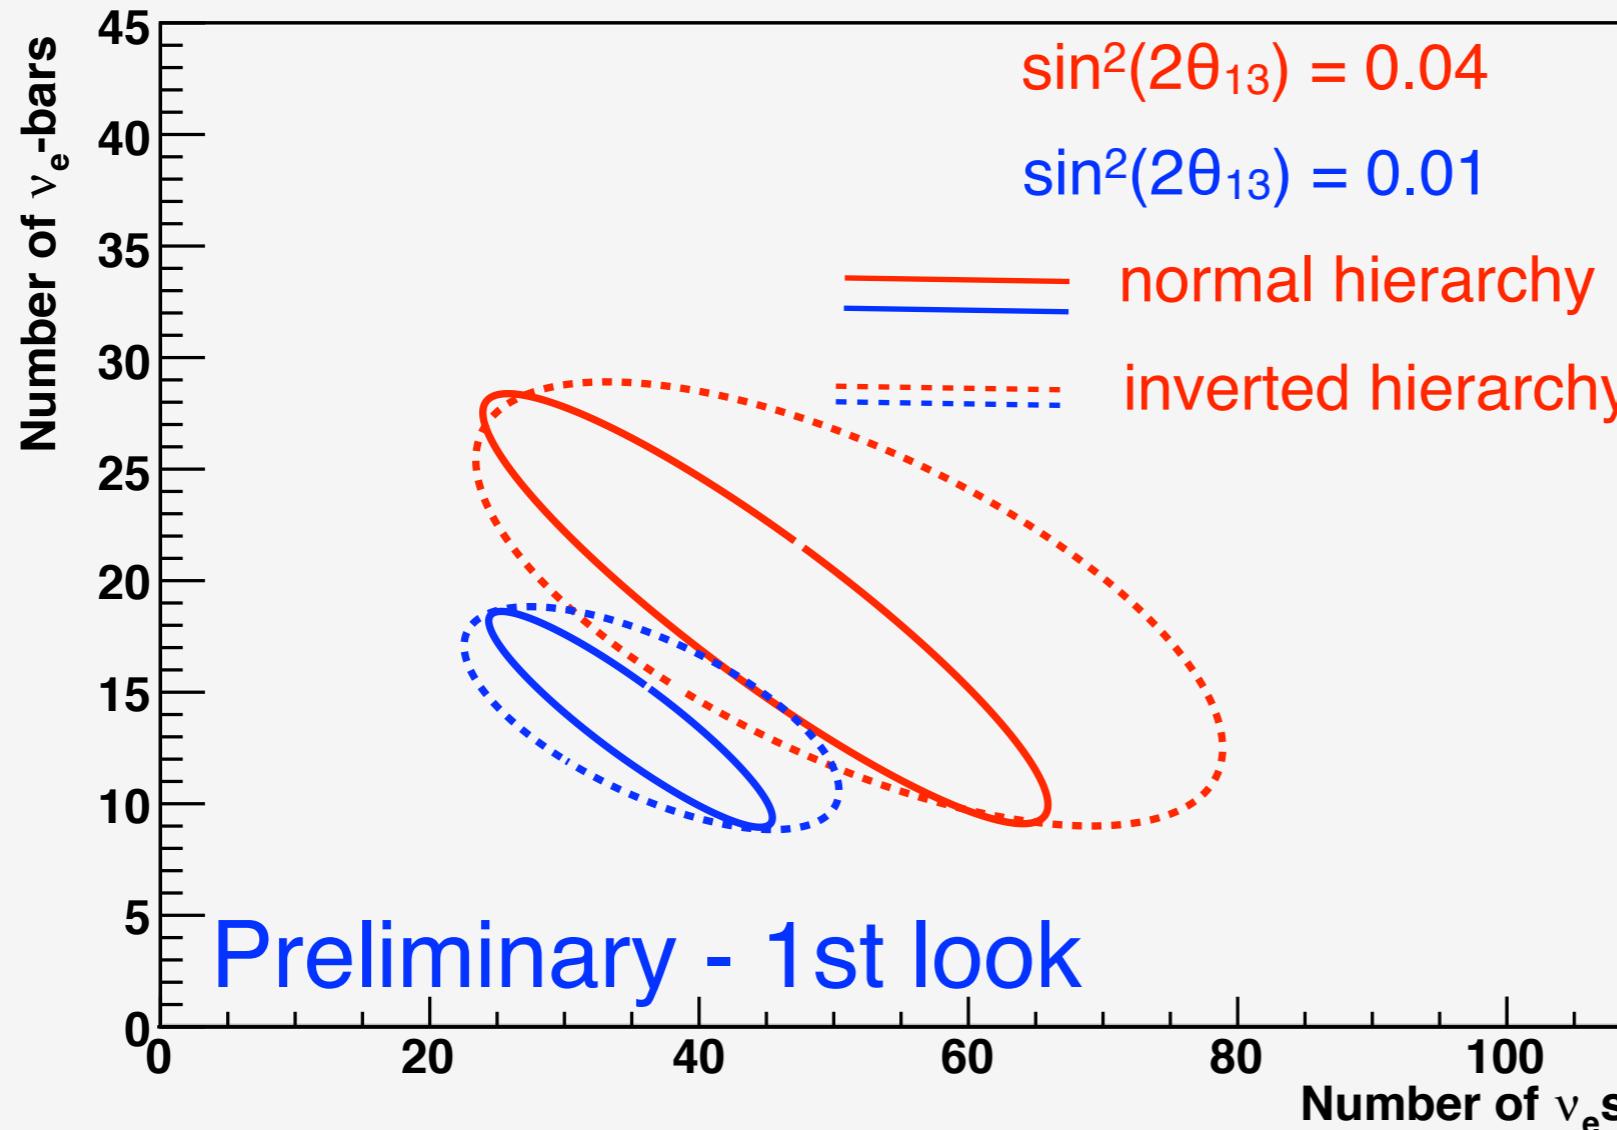

- For  $\sin^2(2\theta_{13}) > 0.03$  sensitivity to CP violation has only weak dependence on the values of  $\theta_{13}$
- As seen earlier, for low values of  $\sin^2(2\theta_{13}) \sim < 0.03$ , the two ellipses in the DUSEL beam begin to overlap affecting CP and mass hierarchy determination
- Resolving this ambiguity is a significant experimental challenge
  - Interesting possibility: study 2nd maximum ( $\delta_{CP}=3\pi/2$ ) CP effects there~3 times larger, matter effects smaller

# Ellipses for Low Energy

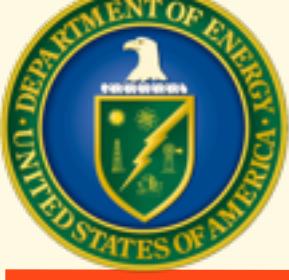

5yr  $\nu$ , 5yr  $\bar{\nu}$ -bar, 2300kW, 40kT  $\epsilon=1$ ,  $0.6 < E < 1.2$  GeV

Relatively small difference between 2 mass hierarchies

For this beam statistics are poor in this limited energy region

The efficiency difference between WC and LAr is less here

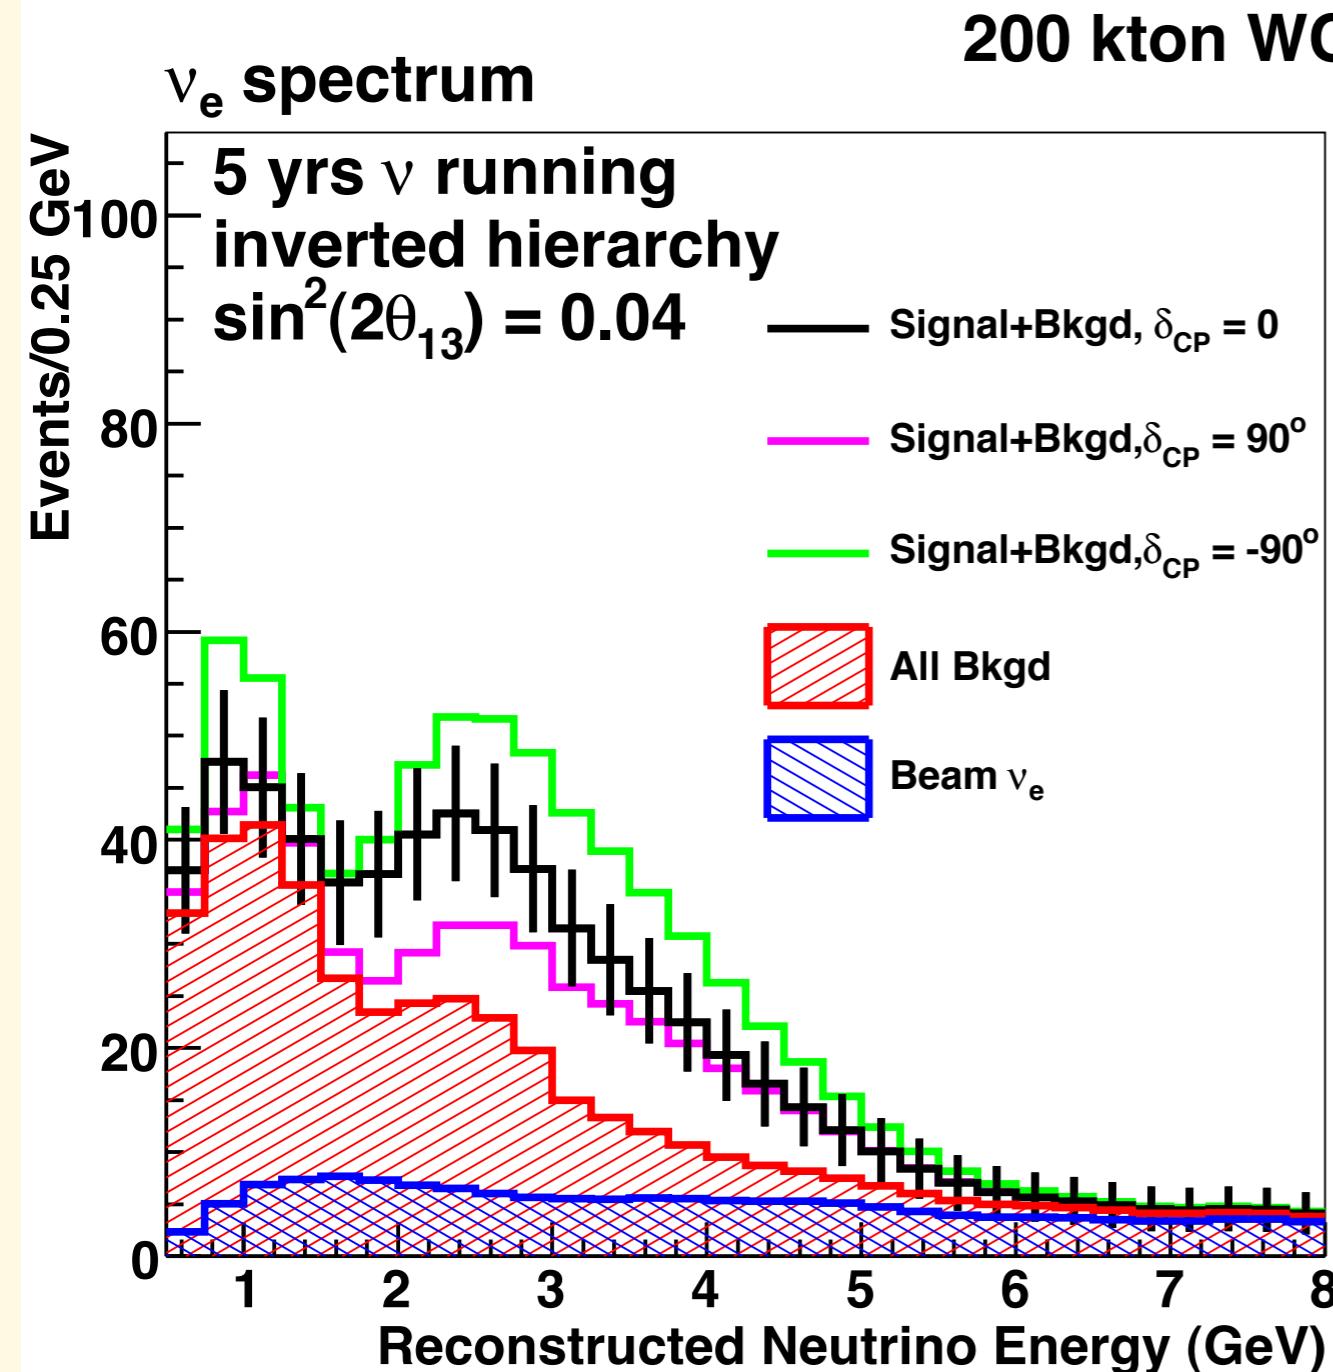

# Energy Spectra (700kW)

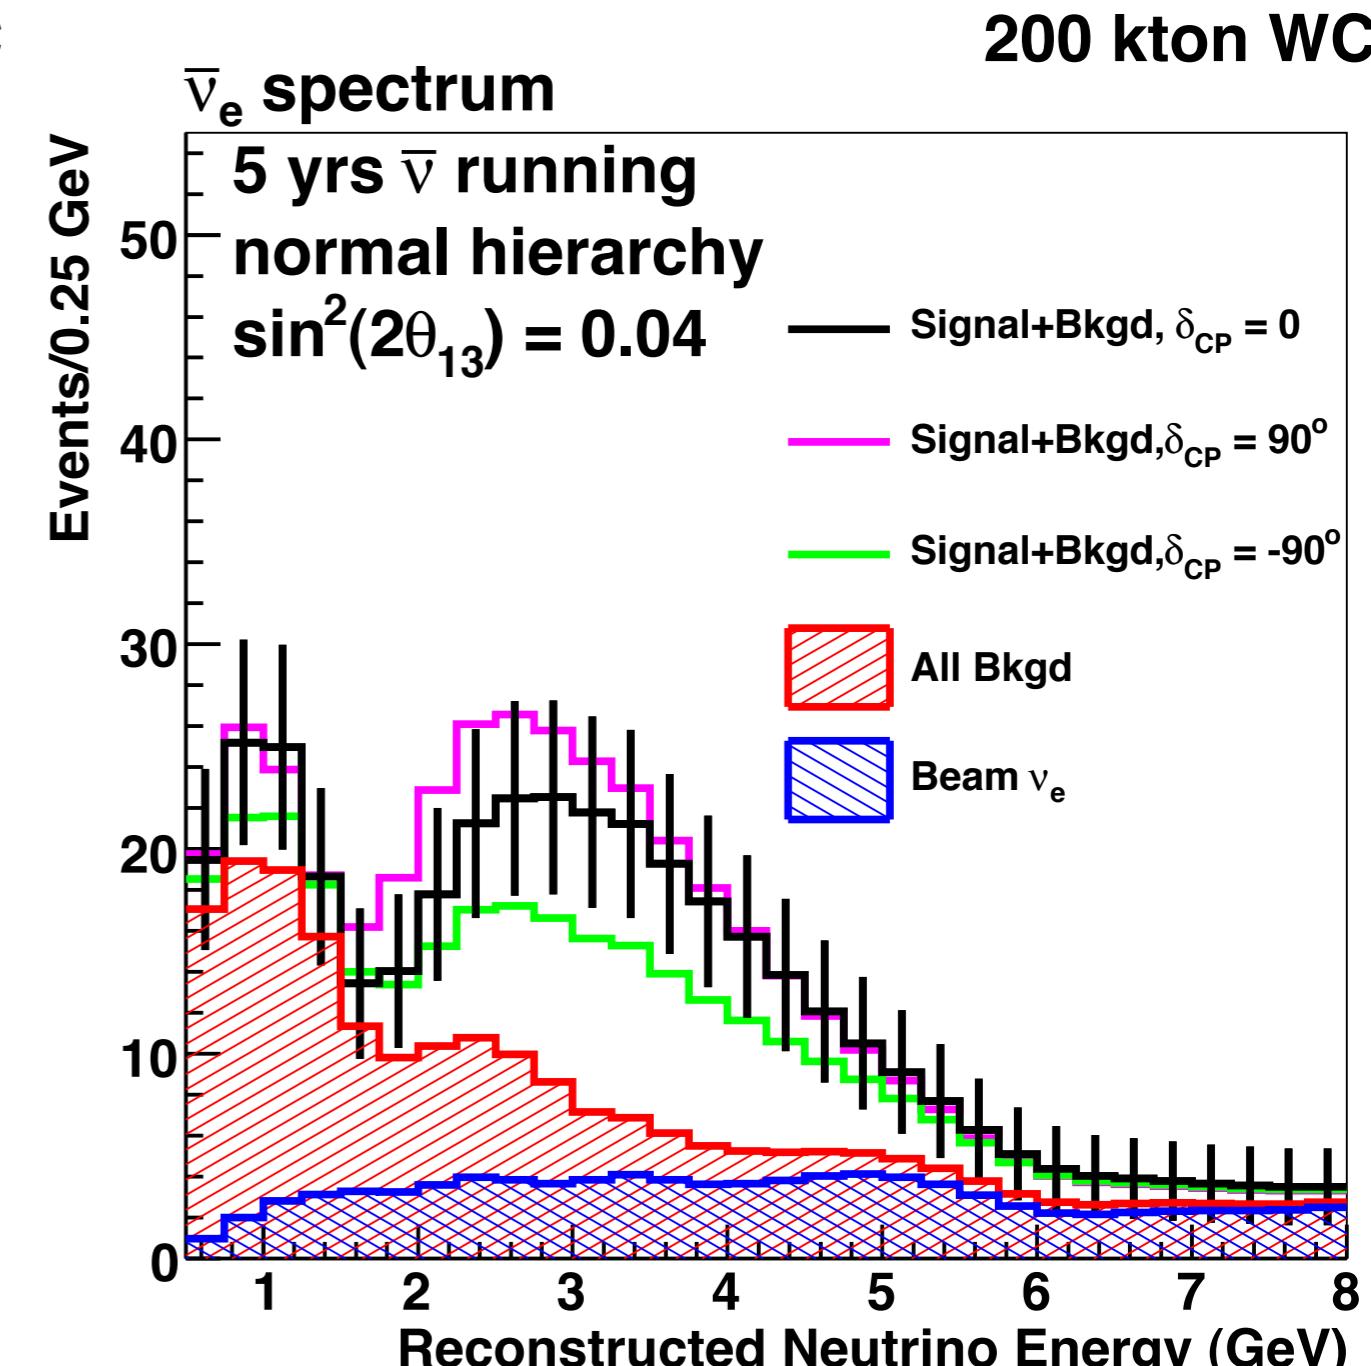

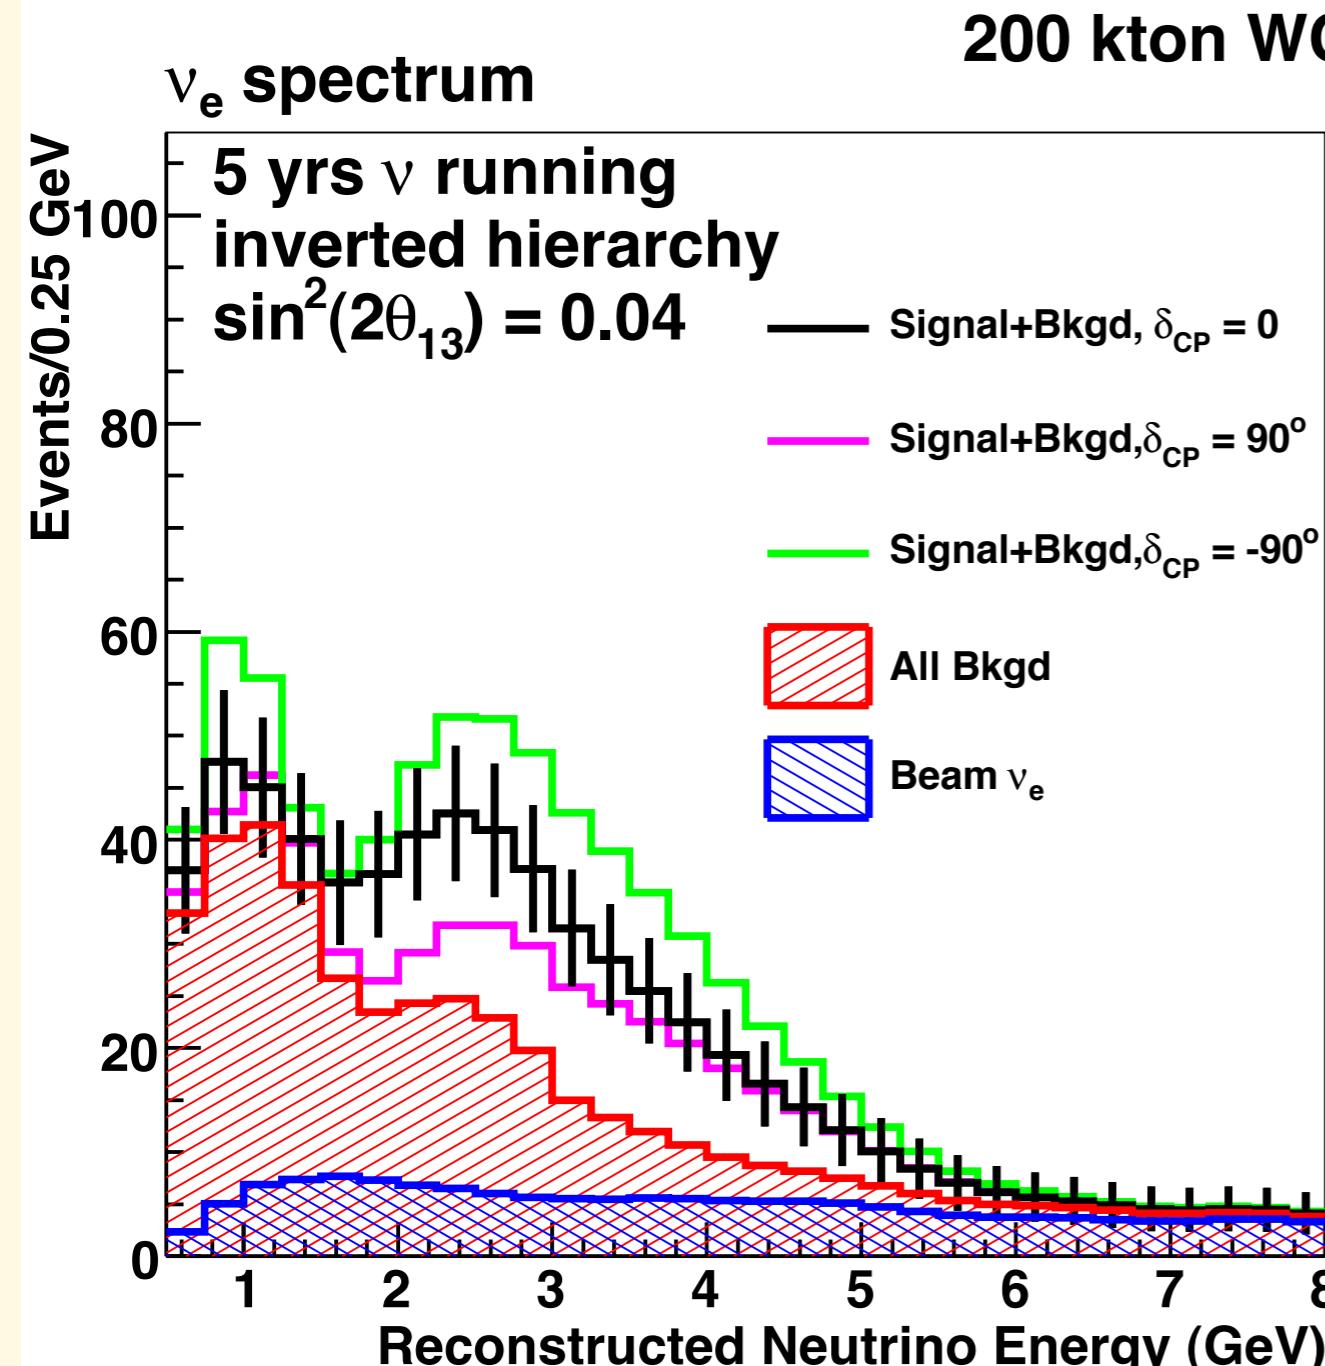

# Energy Spectra (700kW)

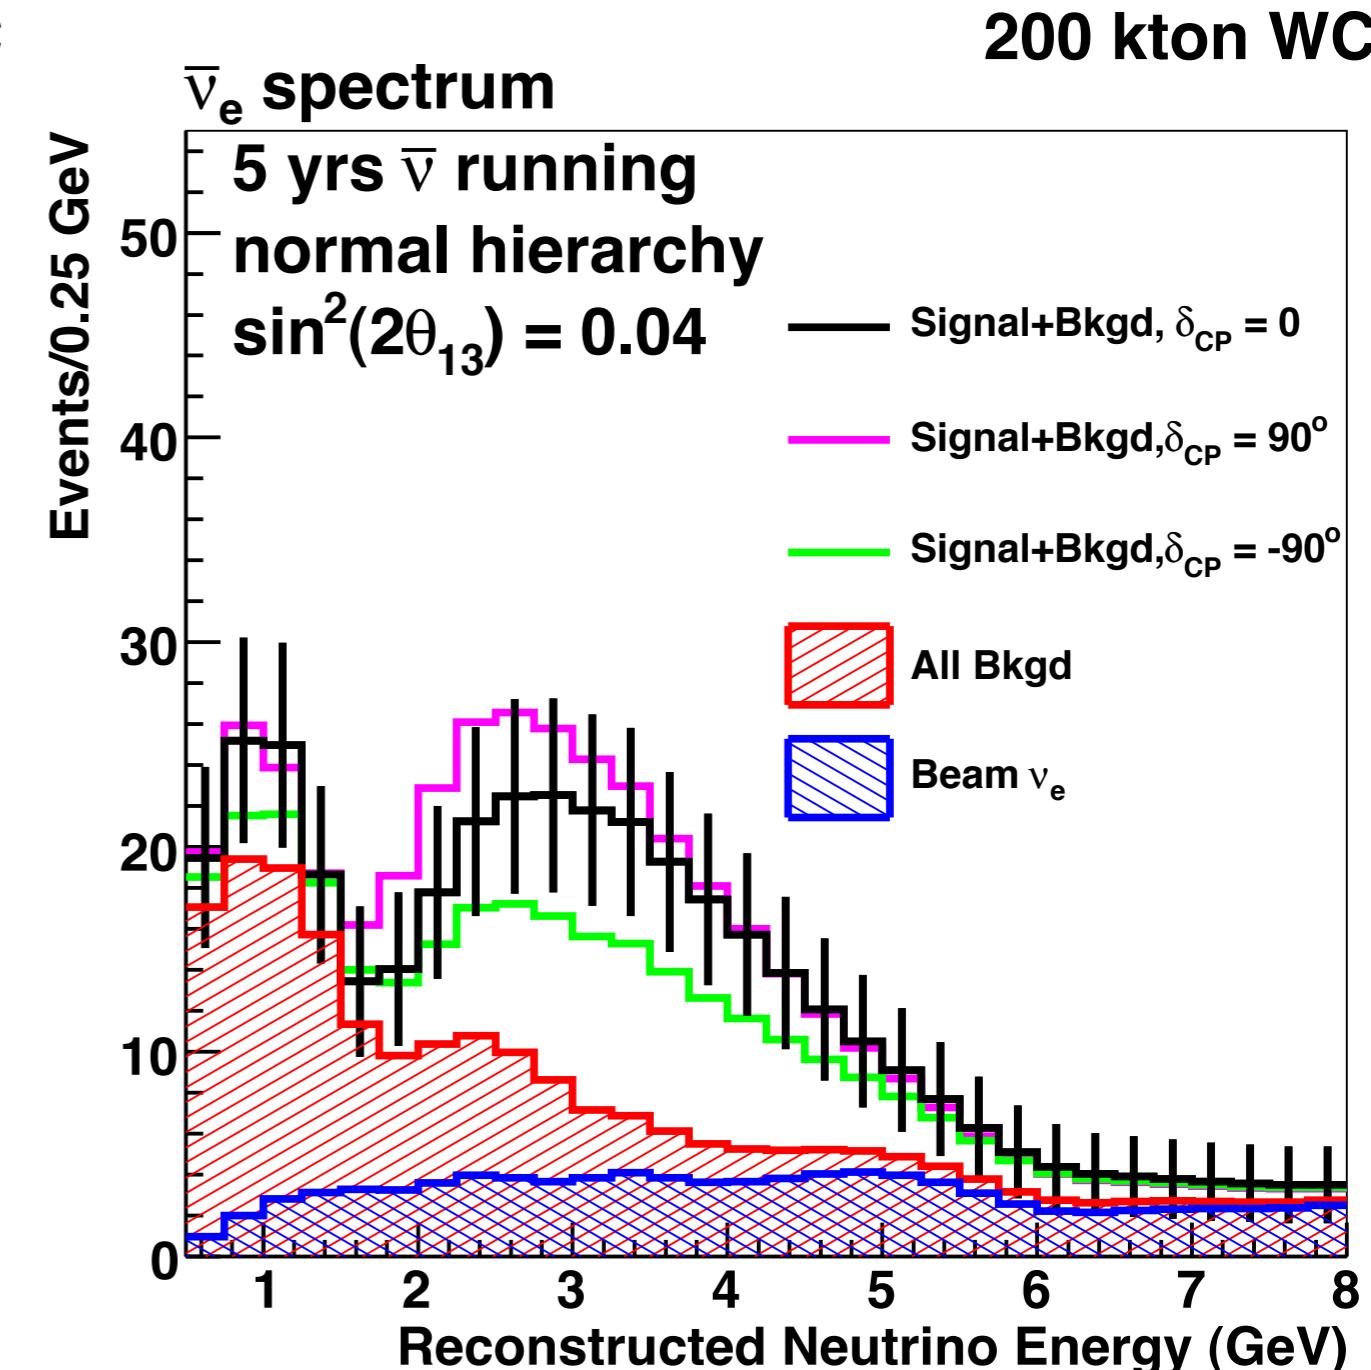

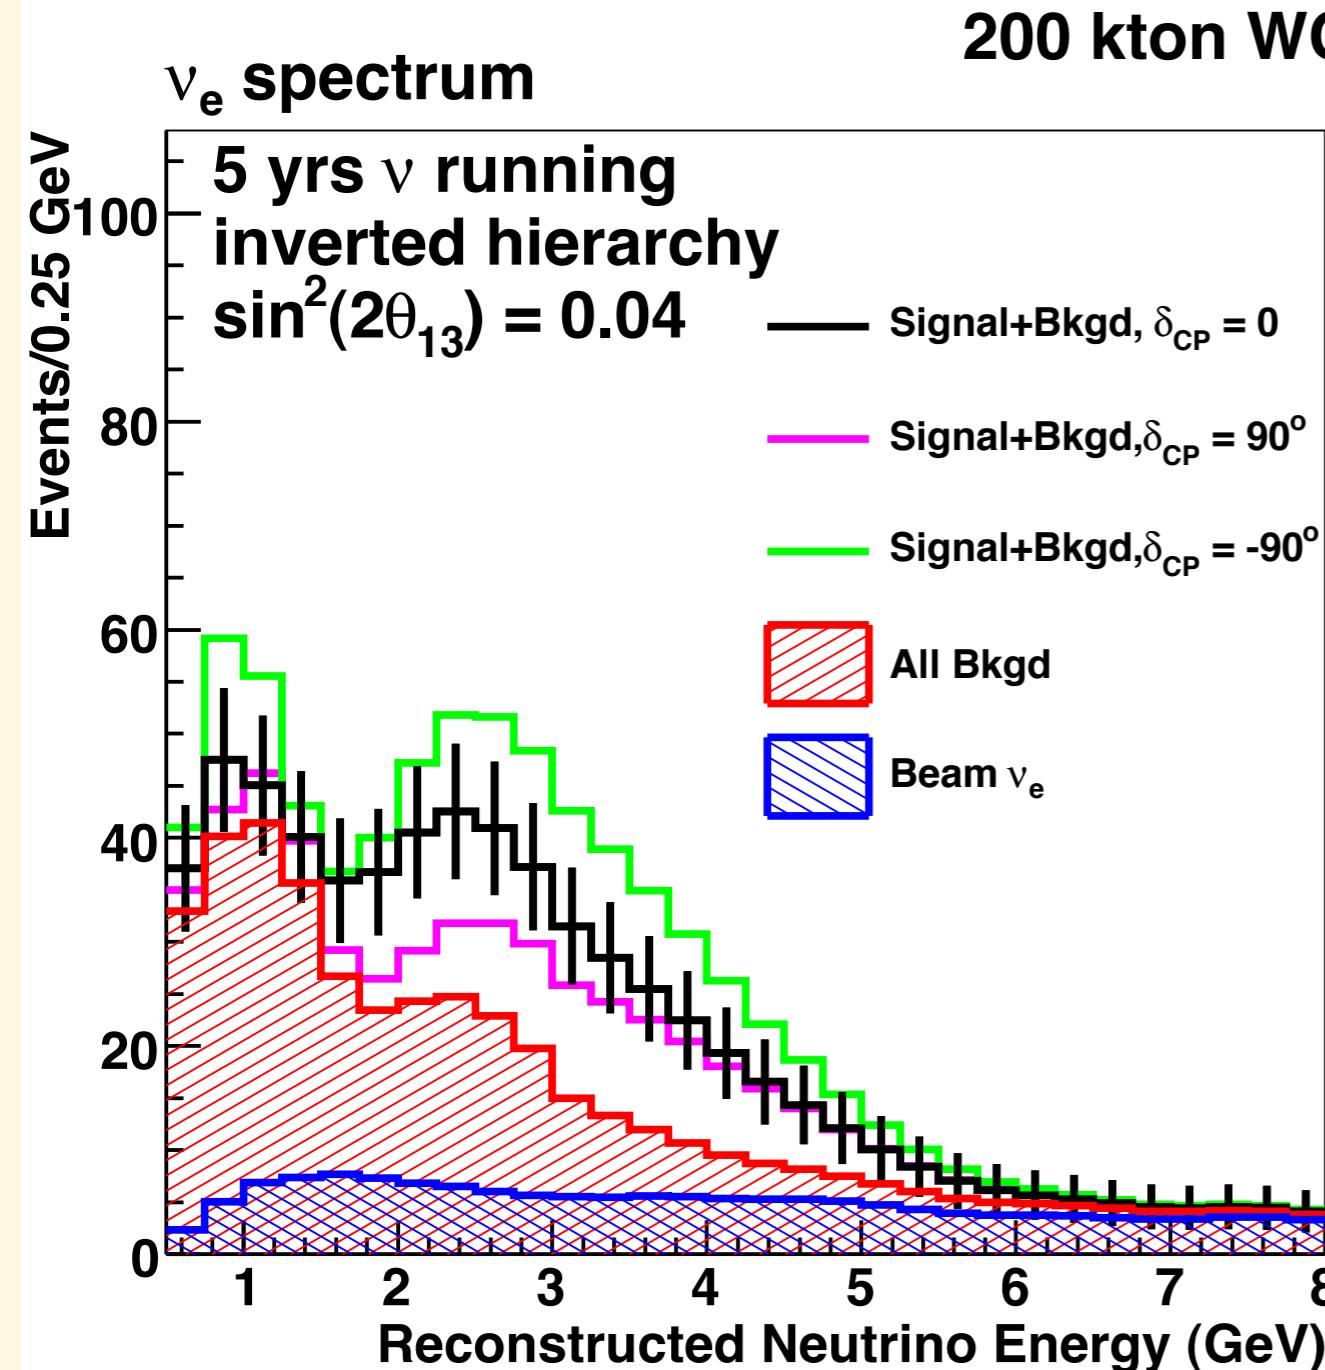

# Energy Spectra (700kW)

# Energy Spectra (700kW)

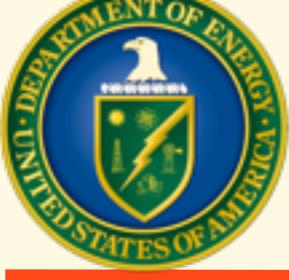

The statistics at 2nd maximum are rather poor  
and the backgrounds quite high

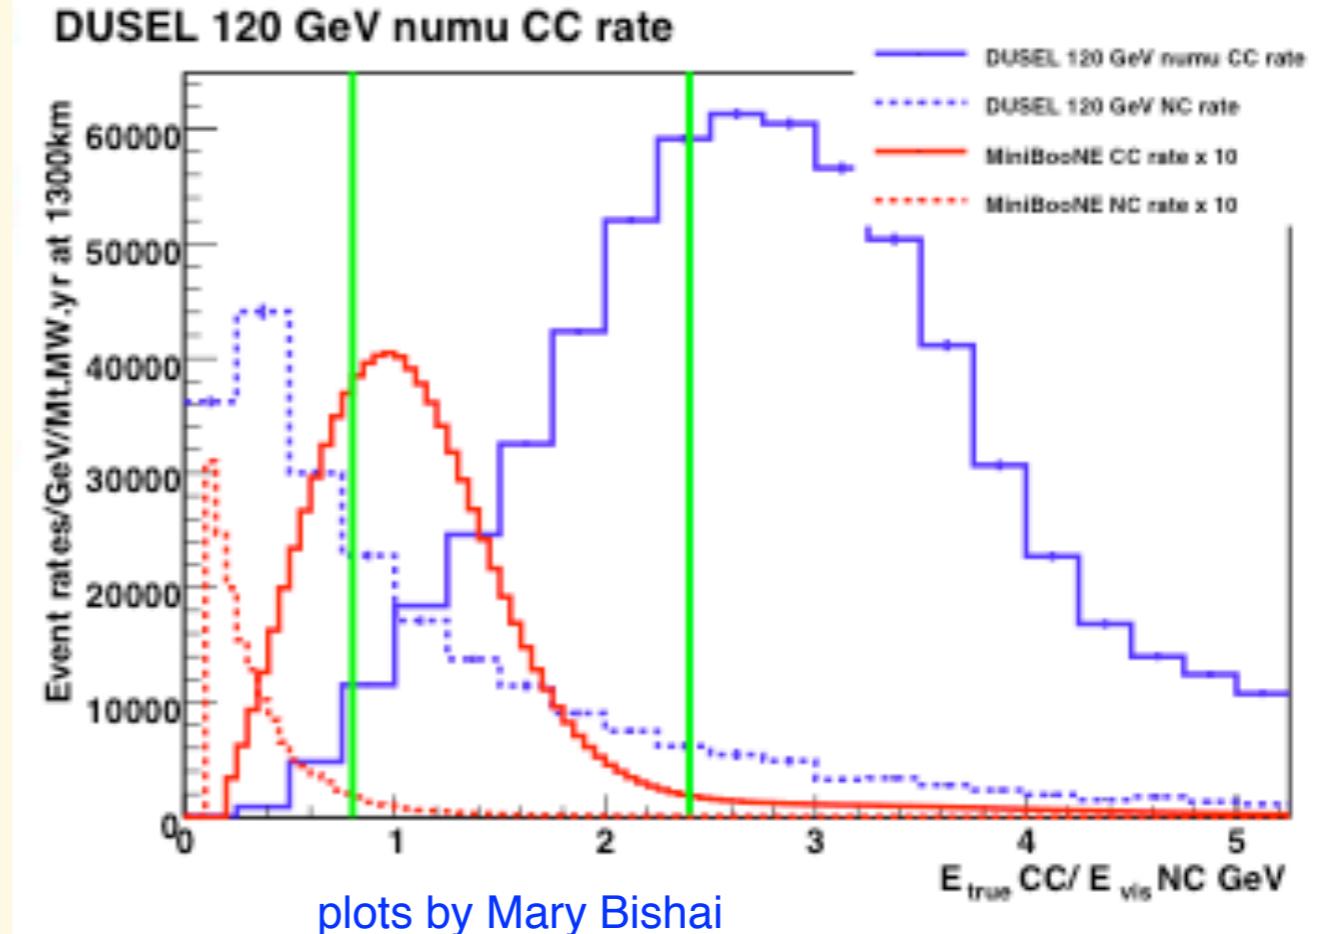

# $\nu$ beam from 8 GeV p's

# $\nu$ beam from 8 GeV p's

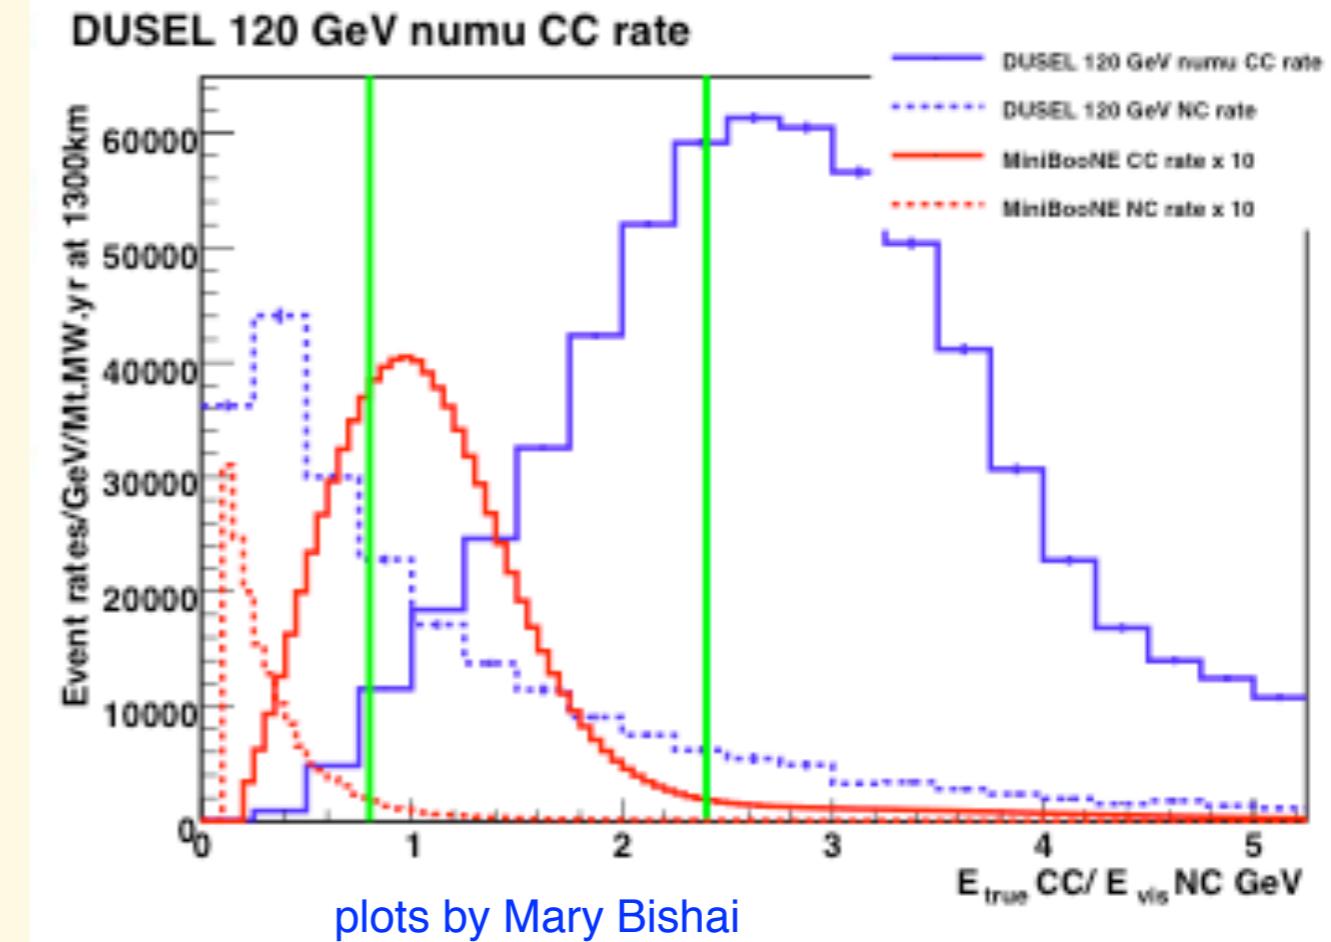

# $\nu$ beam from 8 GeV p's

## Advantages

- CC/NC ratio higher by ~50
- Hence NC background down
- Optimized beam design could decrease  $\nu_e$  background from  $\mu$  decays by ~3-4

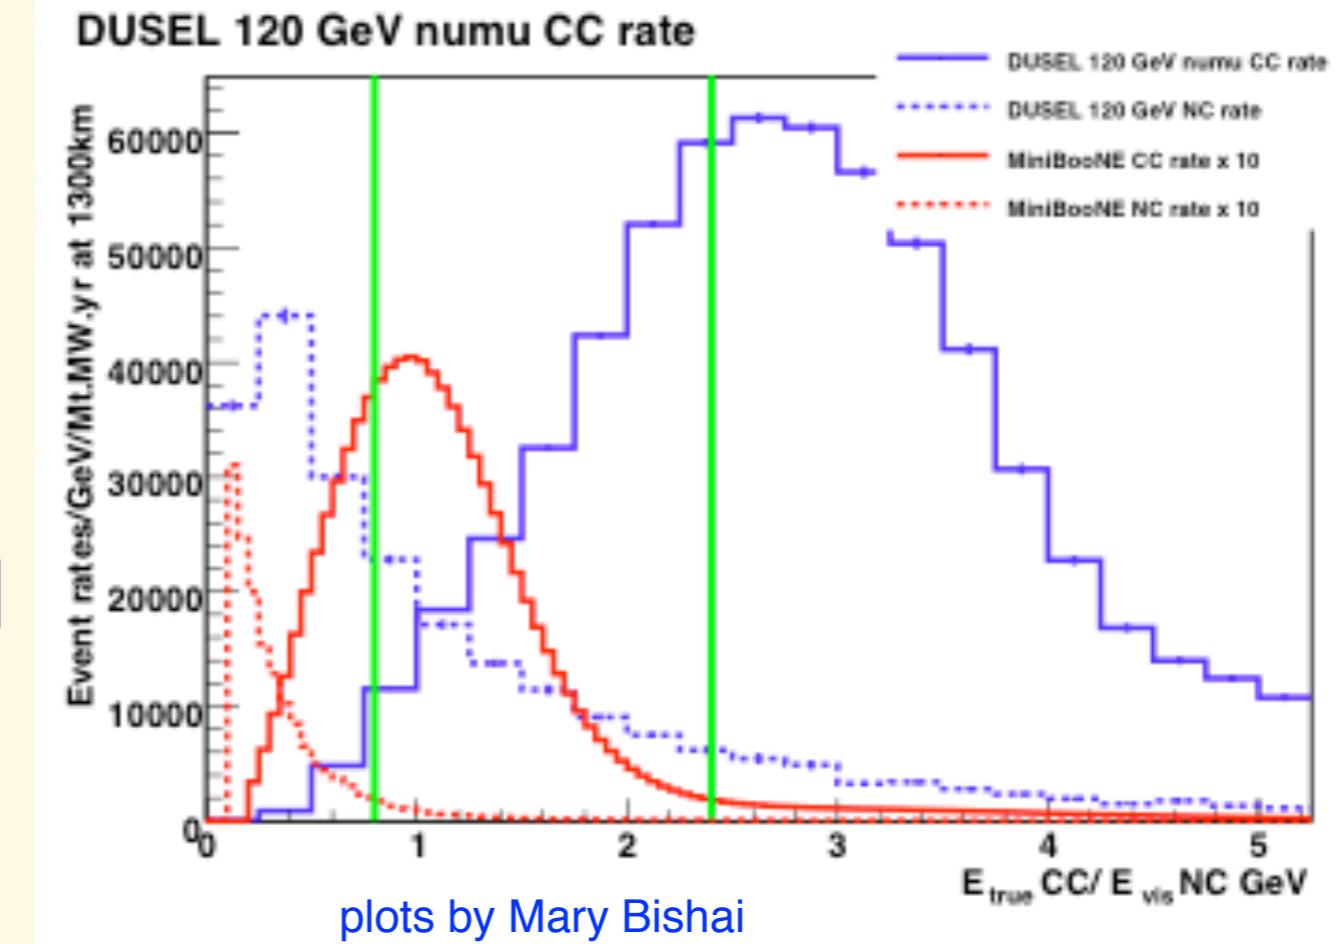

# $\nu$ beam from 8 GeV p's

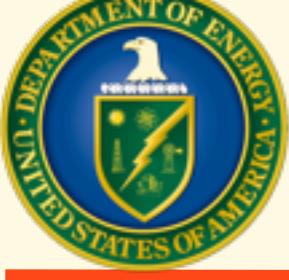

## Advantages

- CC/NC ratio higher by ~50
- Hence NC background down
- Optimized beam design could decrease  $\nu_e$  background from  $\mu$  decays by ~3-4

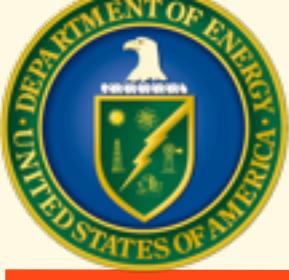

So far no detailed studies exist of this option

My “back-of-the-envelope” calculations indicate that for 1MW, 200 kt and 3 yrs one might see ~30-40  $\nu_e$  events with low background for  $\sin^2(2\theta_{13})=0.01$

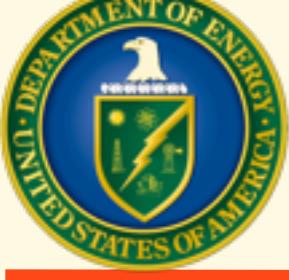

# Other Project X Opportunities

# Other Project X Opportunities

- Near Detector Physics

# Other Project X Opportunities

- Near Detector Physics
  - Copious source of neutrinos in the 1-4 GeV range (exotica?)

# Other Project X Opportunities

- Near Detector Physics
  - Copious source of neutrinos in the 1-4 GeV range (exotica?)
  - Possibilities for specialized experiments in front of Near Detector

# Other Project X Opportunities

- Near Detector Physics
  - Copious source of neutrinos in the 1-4 GeV range (exotica?)
  - Possibilities for specialized experiments in front of Near Detector
- Experiments based on 3 and/or 8 GeV proton beams (versatility of Project X)

# Other Project X Opportunities

- Near Detector Physics
  - Copious source of neutrinos in the 1-4 GeV range (exotica?)
  - Possibilities for specialized experiments in front of Near Detector
- Experiments based on 3 and/or 8 GeV proton beams (versatility of Project X)
- Investigation of LSND/MiniBooNE anomaly

# Other Project X Opportunities

- Near Detector Physics
  - Copious source of neutrinos in the 1-4 GeV range (exotica?)
  - Possibilities for specialized experiments in front of Near Detector
- Experiments based on 3 and/or 8 GeV proton beams (versatility of Project X)
  - Investigation of LSND/MiniBooNE anomaly
  - Not much work in this area so far

# Non- $\nu_e$ Oscillation Physics

What is the deep underlying principle that determines the mass splittings and the mixing angles?

We might get some insight into this question by looking for patterns and symmetries eg is  $\sin^2(2\theta_{23})$  exactly=1? (analogy: Mendeleev Table)

# Non- $\nu_e$ Oscillation Physics

What is the deep underlying principle that determines the mass splittings and the mixing angles?

We might get some insight into this question by looking for patterns and symmetries eg is  $\sin^2(2\theta_{23})$  exactly=1? (analogy: Mendeleev Table)

Mixing angles seem to exhibit a pattern - “tri-bimaximal mixing”

Current experimental pattern:

$$\begin{aligned}\sin^2 \theta_{13} &< 0.04 \\ |\sin^2 \theta_{12} - \frac{1}{3}| &< 0.04 \\ |\sin^2 \theta_{23} - \frac{1}{2}| &< 0.12\end{aligned}$$

$$U_{TBM} = \begin{pmatrix} \sqrt{\frac{2}{3}} & \sqrt{\frac{1}{3}} & 0 \\ -\sqrt{\frac{1}{6}} & \sqrt{\frac{1}{3}} & \sqrt{\frac{1}{2}} \\ \sqrt{\frac{1}{6}} & -\sqrt{\frac{1}{3}} & \sqrt{\frac{1}{2}} \end{pmatrix}$$

# Non- $\nu_e$ Oscillation Physics

What is the deep underlying principle that determines the mass splittings and the mixing angles?

We might get some insight into this question by looking for patterns and symmetries eg is  $\sin^2(2\theta_{23})$  exactly=1? (analogy: Mendeleev Table)

Mixing angles seem to exhibit a pattern - “tri-bimaximal mixing”

Current experimental pattern:

# Transition Probability

$$P(\nu_\mu \rightarrow \nu_e) \approx \sin^2(2\theta_{13}) \sin^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) + \text{Main "atmospheric" term}$$
$$\sin^2(2\theta_{12}) \cos^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) + \text{Solar term}$$
$$\sin(2\theta_{13}) \sin(2\theta_{23}) \sin(2\theta_{12}) \sin\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) \sin\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) \cos\left(1.27 \Delta m_{32}^2 \frac{L}{E} \pm \delta_{CP}\right)$$

Interference term

# Transition Probability

$$P(\nu_\mu \rightarrow \nu_e) \approx \sin^2(2\theta_{13}) \sin^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) + \text{Main "atmospheric" term}$$
$$\sin^2(2\theta_{12}) \cos^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) + \text{Solar term}$$
$$\sin(2\theta_{13}) \sin(2\theta_{23}) \sin(2\theta_{12}) \sin\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) \sin\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) \cos\left(1.27 \Delta m_{32}^2 \frac{L}{E} \pm \delta_{CP}\right)$$

Interference term

- Transition depends on  $\theta_{12}$ ,  $\Delta m_{21}^2$ ,  $\Delta m_{31}^2$ ,  $\theta_{23}$ , mass hierarchy,  $\theta_{13}$ ,  $\delta_{CP}$

# Transition Probability

$$P(\nu_\mu \rightarrow \nu_e) \approx \sin^2(2\theta_{13}) \sin^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) + \text{Main "atmospheric" term}$$
$$\sin^2(2\theta_{12}) \cos^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) + \text{Solar term}$$
$$\sin(2\theta_{13}) \sin(2\theta_{23}) \sin(2\theta_{12}) \sin\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) \sin\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) \cos\left(1.27 \Delta m_{32}^2 \frac{L}{E} \pm \delta_{CP}\right)$$

Interference term

- Transition depends on  $\theta_{12}$ ,  $\Delta m_{21}^2$ ,  $\Delta m_{31}^2$ ,  $\theta_{23}$ , mass hierarchy,  $\theta_{13}$ ,  $\delta_{CP}$
- If mass hierarchy is normal nu rate is enhanced, nu-bar suppressed; vice-versa for inverted hierarchy

# Transition Probability

$$P(\nu_\mu \rightarrow \nu_e) \approx \sin^2(2\theta_{13}) \sin^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) + \text{Main "atmospheric" term}$$
$$\sin^2(2\theta_{12}) \cos^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) + \text{Solar term}$$
$$\sin(2\theta_{13}) \sin(2\theta_{23}) \sin(2\theta_{12}) \sin\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) \sin\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) \cos\left(1.27 \Delta m_{32}^2 \frac{L}{E} \pm \delta_{CP}\right)$$

Interference term

- Transition depends on  $\theta_{12}$ ,  $\Delta m_{21}^2$ ,  $\Delta m_{31}^2$ ,  $\theta_{23}$ , mass hierarchy,  $\theta_{13}$ ,  $\delta_{CP}$
- If mass hierarchy is normal nu rate is enhanced, nu-bar suppressed; vice-versa for inverted hierarchy
- The first 3 are known well ( $\sim$ few %) - fixed in fits

# Transition Probability

$$P(\nu_\mu \rightarrow \nu_e) \approx \sin^2(2\theta_{13}) \sin^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) + \text{Main "atmospheric" term}$$
$$\sin^2(2\theta_{12}) \cos^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) + \text{Solar term}$$
$$\sin(2\theta_{13}) \sin(2\theta_{23}) \sin(2\theta_{12}) \sin\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) \sin\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) \cos\left(1.27 \Delta m_{32}^2 \frac{L}{E} \pm \delta_{CP}\right)$$

Interference term

- Transition depends on  $\theta_{12}$ ,  $\Delta m_{21}^2$ ,  $\Delta m_{31}^2$ ,  $\theta_{23}$ , mass hierarchy,  $\theta_{13}$ ,  $\delta_{CP}$
- If mass hierarchy is normal nu rate is enhanced, nu-bar suppressed; vice-versa for inverted hierarchy
- The first 3 are known well ( $\sim$ few %) - fixed in fits
- $\sin^2\theta_{23}$  is only known to  $\sim$ 10-15%

# Transition Probability

$$P(\nu_\mu \rightarrow \nu_e) \approx \sin^2(2\theta_{13}) \sin^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) + \text{Main "atmospheric" term}$$
$$\sin^2(2\theta_{12}) \cos^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) + \text{Solar term}$$
$$\sin(2\theta_{13}) \sin(2\theta_{23}) \sin(2\theta_{12}) \sin\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) \sin\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) \cos\left(1.27 \Delta m_{32}^2 \frac{L}{E} \pm \delta_{CP}\right)$$

Interference term

- Transition depends on  $\theta_{12}$ ,  $\Delta m_{21}^2$ ,  $\Delta m_{31}^2$ ,  $\theta_{23}$ , mass hierarchy,  $\theta_{13}$ ,  $\delta_{CP}$
- If mass hierarchy is normal nu rate is enhanced, nu-bar suppressed; vice-versa for inverted hierarchy
- The first 3 are known well ( $\sim$ few %) - fixed in fits
- $\sin^2\theta_{23}$  is only known to  $\sim$ 10-15%
- mass hierarchy,  $\theta_{13}$  and  $\delta_{CP}$  are unknown ( $\theta_{13}$  small)

# Transition Probability

$$P(\nu_\mu \rightarrow \nu_e) \approx \sin^2(2\theta_{13}) \sin^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) + \text{Main "atmospheric" term}$$
$$\sin^2(2\theta_{12}) \cos^2(\theta_{23}) \sin^2\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) + \text{Solar term}$$
$$\sin(2\theta_{13}) \sin(2\theta_{23}) \sin(2\theta_{12}) \sin\left(1.27 \Delta m_{31}^2 \frac{L}{E}\right) \sin\left(1.27 \Delta m_{21}^2 \frac{L}{E}\right) \cos\left(1.27 \Delta m_{32}^2 \frac{L}{E} \pm \delta_{CP}\right)$$

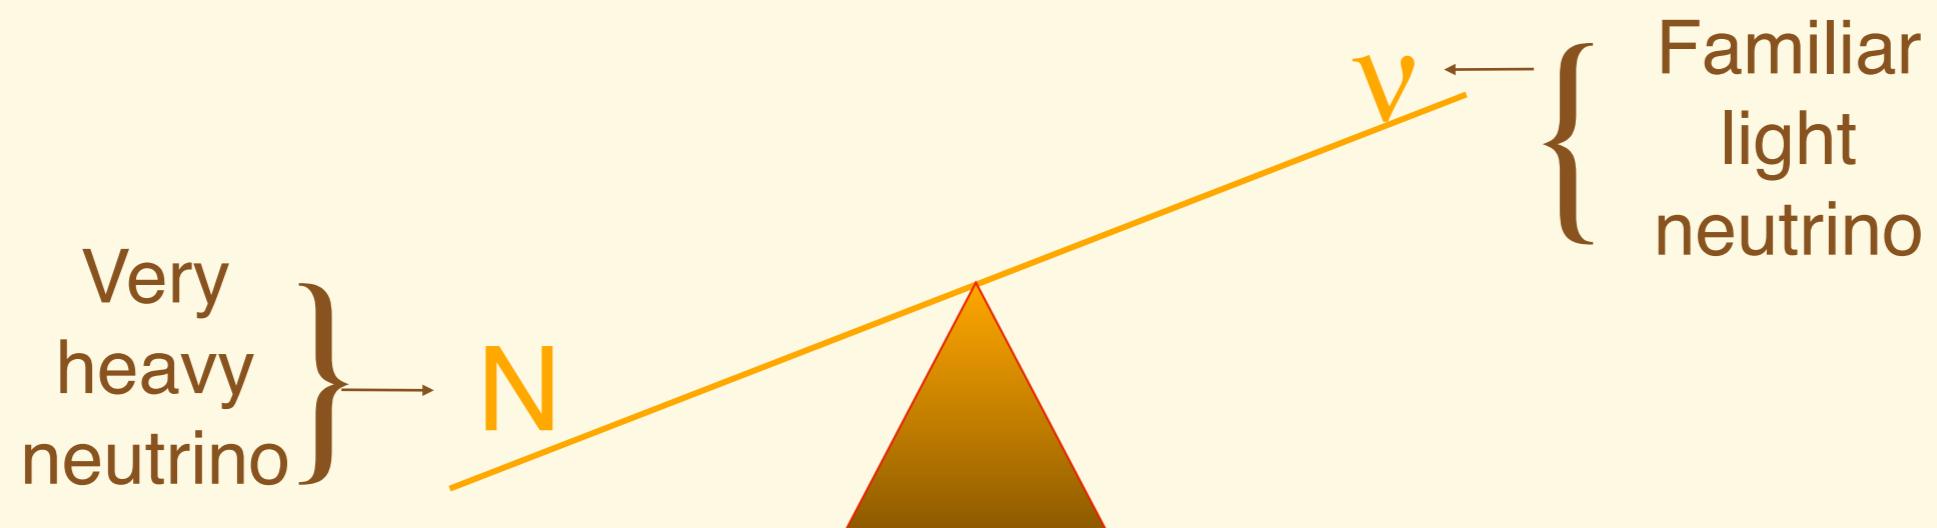

Interference term

- Transition depends on  $\theta_{12}$ ,  $\Delta m_{21}^2$ ,  $\Delta m_{31}^2$ ,  $\theta_{23}$ , mass hierarchy,  $\theta_{13}$ ,  $\delta_{CP}$
- If mass hierarchy is normal nu rate is enhanced, nu-bar suppressed; vice-versa for inverted hierarchy
- The first 3 are known well ( $\sim$ few %) - fixed in fits
- $\sin^2\theta_{23}$  is only known to  $\sim$ 10-15%
- mass hierarchy,  $\theta_{13}$  and  $\delta_{CP}$  are unknown ( $\theta_{13}$  small)
- Interference term proportional to  $\sin(2\theta_{13})$ , not  $\sin^2(2\theta_{13})$

# Heavy Neutrino

A natural mechanism to explain the very small mass of the neutrinos is to postulate a *very heavy neutrino* and a see-saw mechanism

CP violation in early-universe decays of these *very heavy neutrinos* creates a *lepton-antilepton* asymmetry.

Standard-Model processes convert part of this *lepton-antilepton* asymmetry to a *nucleon-antinucleon* asymmetry.

# Leptogenesis

*Leptogenesis and light-neutrino oscillation are connected.*

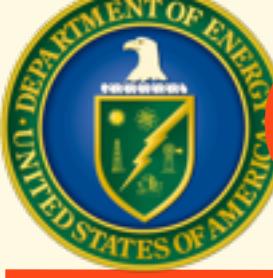

*Although possible, it would be unnatural for there to be leptogenesis but no light-neutrino CP violation.*

*CP violation in light-neutrino oscillation would establish leptonic CP violation, and make leptogenesis more plausible.*
