

Hit repeater and a new way of disambiguation

Piotr Płoński
Warsaw University of Technology

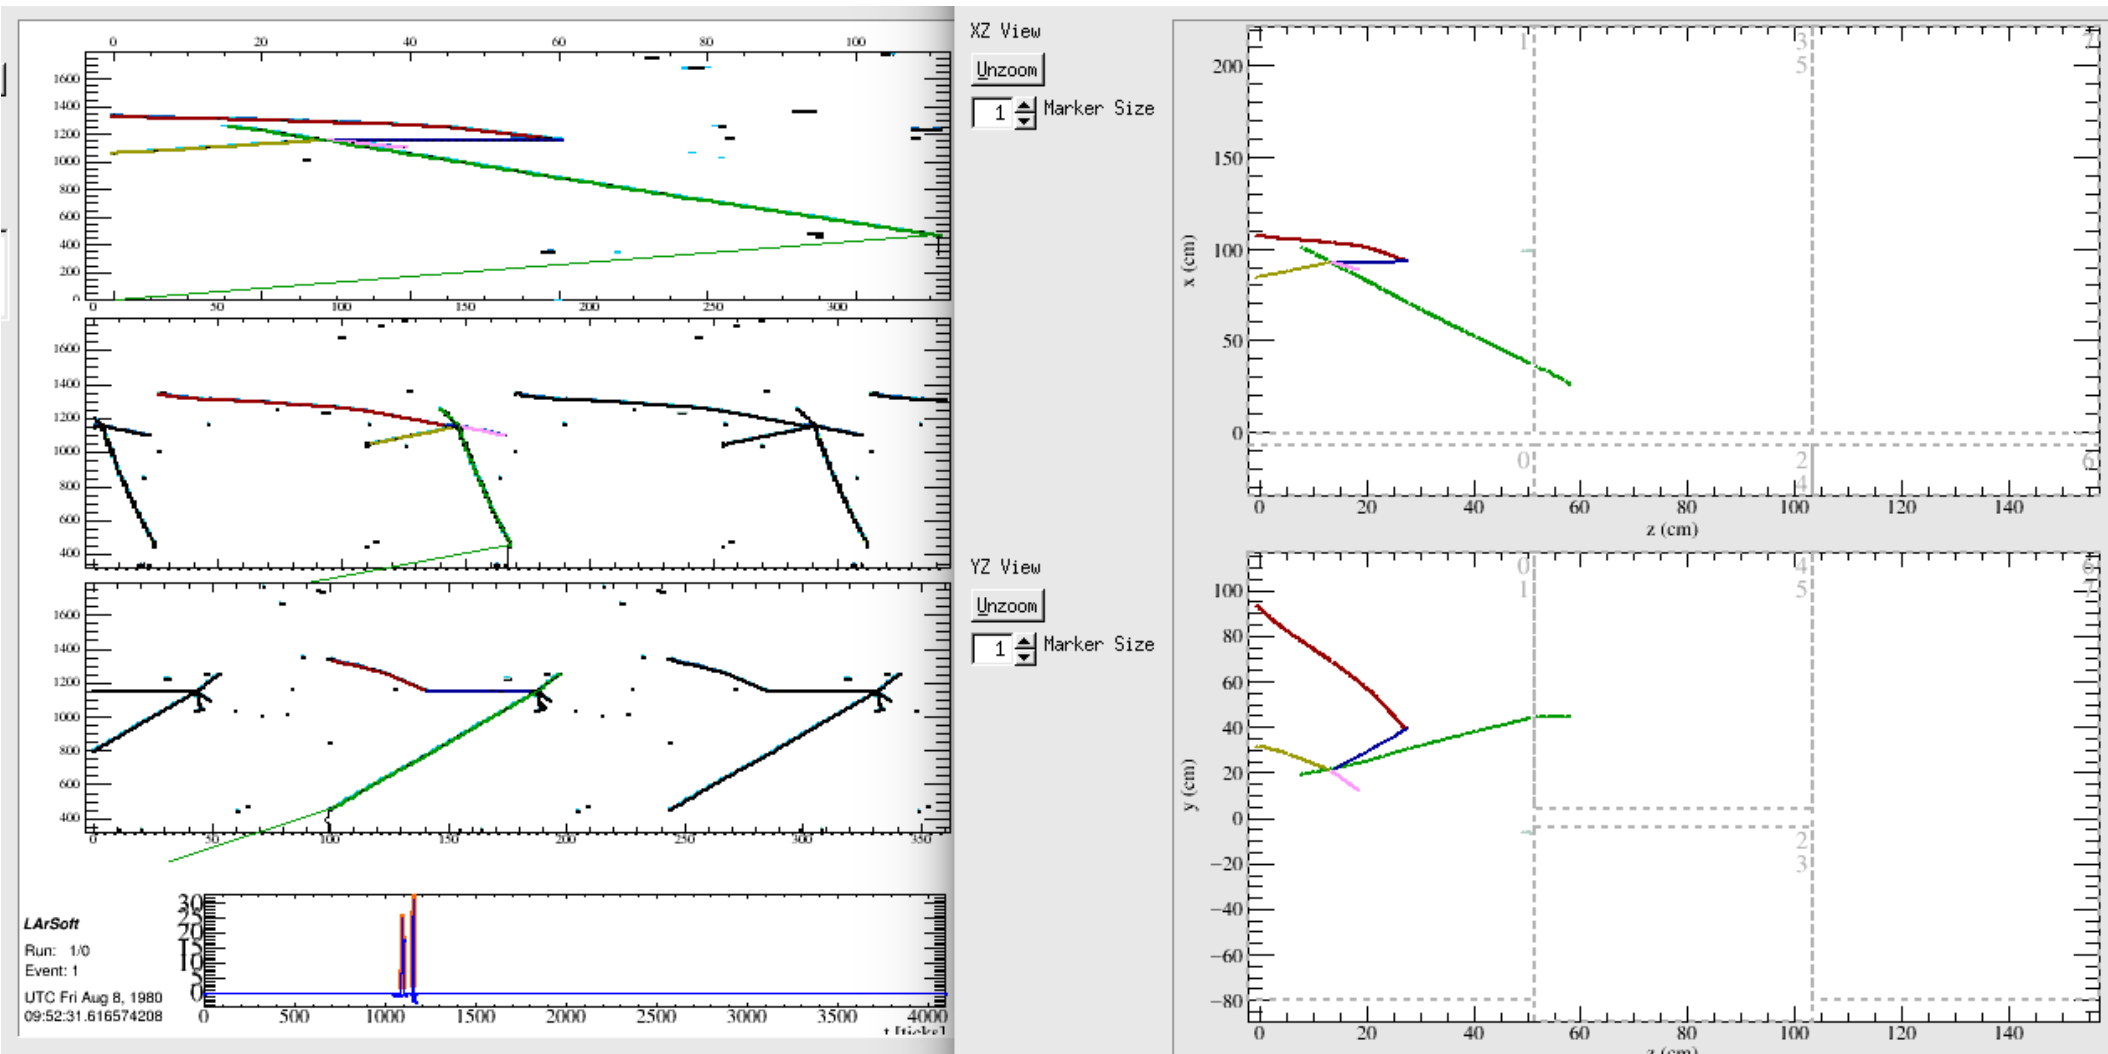

The idea (by Robert Sulej)

- Omit disambiguation step
- Repeat hits on channels with multiple wires
- Run reconstruction on repeated hits
- After 3D reconstruction decide - hits on which wire should be selected
- Allows quick testing existing LArSoft algorithms in "channel" space

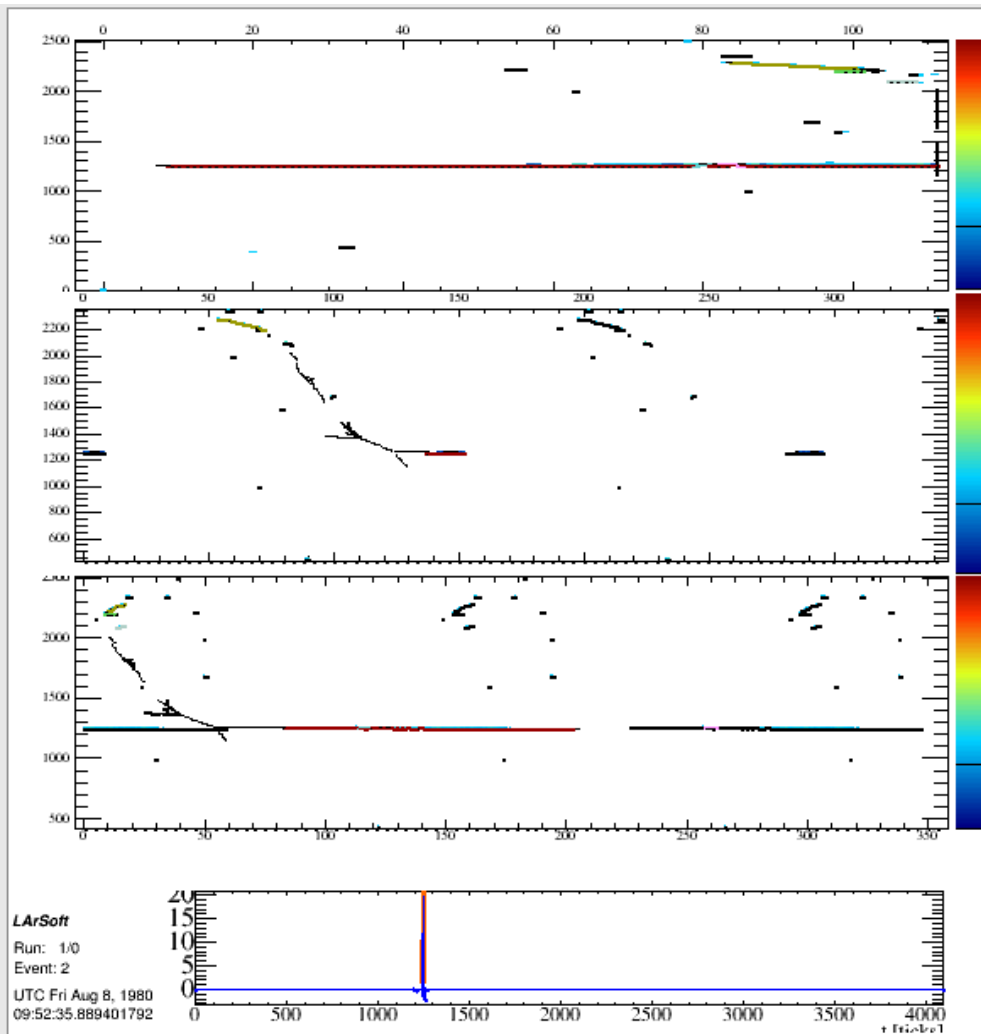

Implementation

- In path `lbncode/lbne/HitFinderLBNE/`
- Module implementation `HitRepeater_module.cc`
- Module parameters in `hitfindermodules_lbne.fcl` in `hit_repeater` definition

Example 1

Next steps

- Disambiguation step is postponed after reconstruction
- There are situations that there are two good responses (example 3). It can be solved by checking for existence of sub-tracks in tracks.
