

Space Charge Effect at DUNE 35-ton

Michael Mooney

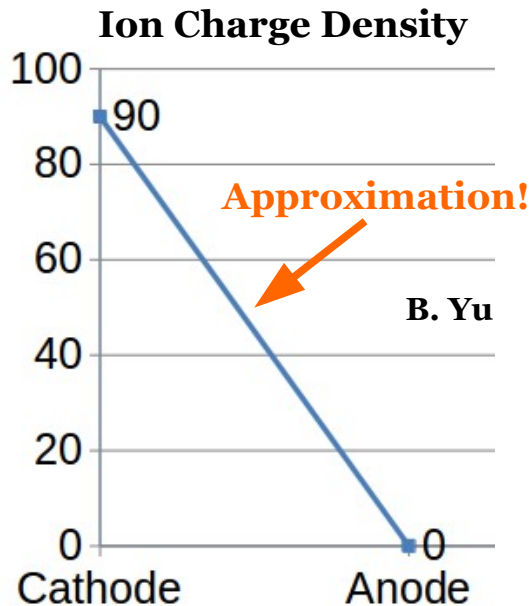

BNL

DUNE 35-ton Sim/Reco/Analysis Meeting

August 19th, 2015

- ◆ Tool exists to study space charge effect at the **MicroBooNE detector**
 - **SpaCE** – Space Charge Estimator
 - Study **simple problems** first in detail with dedicated simulations
 - Also performs calibration using MicroBooNE's UV laser system and cosmic muons (in progress)
 - LArSoft module exists to hold/access SCE offsets
 - Now: extend SCE simulation to **DUNE 35-ton detector**
- ◆ Outline:
 - Brief review of Space Charge Effect (SCE) and SpaCE
 - SCE at DUNE 35-ton detector
 - Updated LArSoft implementation

- ◆ **Space charge:** excess electric **charge** (slow-moving ions) distributed over region of **space** due to cosmic muons passing through the liquid argon
 - Modifies E field in TPC, thus track/shower reconstruction
 - Effect scales with L^3 , $E^{-1.7}$

$$\alpha = \frac{D}{E_0} \sqrt{\frac{K}{\epsilon\mu}}$$

$$\mathbf{v} = \mu\mathbf{E}$$

No Drift!

- ◆ Code written in C++ with ROOT libraries
- ◆ Also makes use of external libraries (ALGLIB)
- ◆ Primary features:
 - Obtain E fields analytically (on 3D grid) via **Fourier series**
 - Use **interpolation** scheme (RBF – radial basis functions) to obtain E fields in between solution points on grid
 - Generate tracks in volume – line of uniformly-spaced points
 - Employ **ray-tracing** to “read out” reconstructed {x,y,z} point for each track point – RKF45 method
- ◆ First implemented effects of uniform space charge deposition without liquid argon flow (only linear space charge density)
 - Also can use **arbitrary space charge configuration**
 - Can model effects of liquid argon flow (but can we trust CFD simulations?)

- ◆ Can use SpaCE to produce displacement maps
 - **Forward transportation:** $\{x, y, z\}_{\text{true}} \rightarrow \{x, y, z\}_{\text{sim}}$
 - Use to **simulate** effect in MC
 - Uncertainties describe accuracy of simulation
 - **Backward transportation:** $\{x, y, z\}_{\text{reco}} \rightarrow \{x, y, z\}_{\text{true}}$
 - Derive from **calibration** and use in data or MC to correct reconstruction bias
 - Uncertainties describe remainder systematic after bias-correction
- ◆ Two principal methods to encode displacement maps:
 - **Matrix representation** – more generic/flexible
 - **Parametric** representation (for now, 5th/7th order polynomials) – fewer parameters
 - Uses matrix representation as input → **use for LArSoft implementation**

Modified E field in 35-ton

$E_{\text{nominal}} = 500 \text{ V/cm}$

$E_{\text{nominal}} = 250 \text{ V/cm}$

E_X

$\Delta E_x/E_{\text{nominal}} [\%]: Z = 0.80 \text{ m}$

$\Delta E_x/E_{\text{nominal}} [\%]: Z = 0.80 \text{ m}$

cathode

anode

E_Y

$\Delta E_y/E_{\text{nominal}} [\%]: Z = 0.80 \text{ m}$

$\Delta E_y/E_{\text{nominal}} [\%]: Z = 0.80 \text{ m}$

Distortions in 35-ton

$E_{\text{nominal}} = 500 \text{ V/cm}$

$E_{\text{nominal}} = 250 \text{ V/cm}$

ΔX

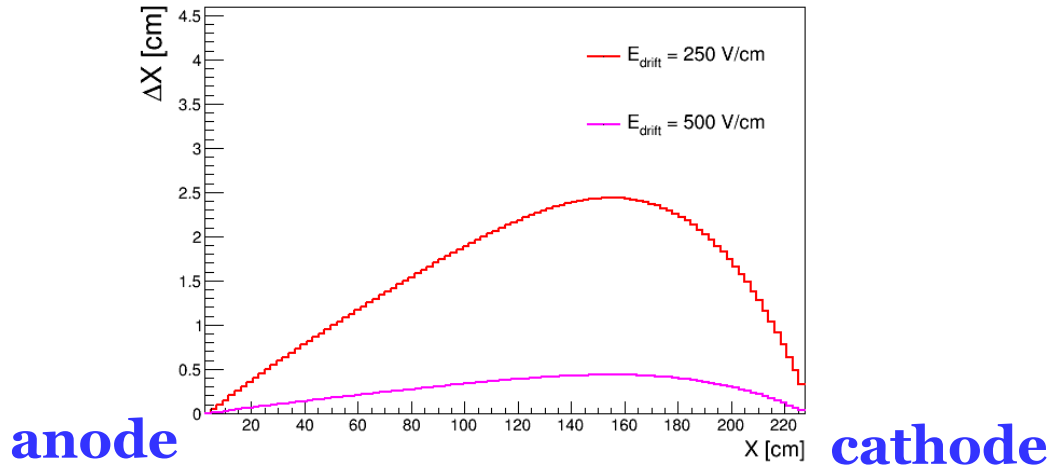

cathode

anode

ΔY

ΔX (center in Y/Z)

ΔY (center in Z, X at cathode)

ΔZ (center in Y, X at cathode)

- ◆ Some things changed in LArSoft code to make work for DUNE 35-ton:
 - New parameters related to specific geometry of detector
 - Different coordinate transforms in larevt's **SpaceCharge** service for different detector geometries – modified “CoordinateType” in `dunetpc/lbne/SpaceCharge/spacecharge_lbne35t.fcl`
 - New ionization electron displacement (distortion) maps
 - Generated by **SpaCE code suite**
 - Using parametrization with polynomials for distortions
- ◆ DUNE 35-ton setup also requires additional features:
 - Storage of several maps to allow for scan over different HV values
 - Use different input files (250-500 V/cm), store in dedicated area
 - Ability to account for multiple TPC's
 - 35-ton has **eight** – see next slide

- ◆ 35-ton has four APA's, each of which are split into two TPC's corresponding to the two sides of the APA's (see top)
 - APA's are of different sizes (see bottom)
 - Two drift lengths (different sides) per APA: **225 cm** and **27.5 cm**

- ◆ Current implementation:
 - Only simulate space charge effect for TPC's with **longer drift length**
 - L^3 dependence of offsets means difference of **~500** in magnitude
 - For now use hard cut on TPCGeo DriftDistance of **50 cm** to exclude short TPC's (LArVoxelReadout.cxx)
 - Use **one** map for other four TPC's
 - APA gaps affect results minimally

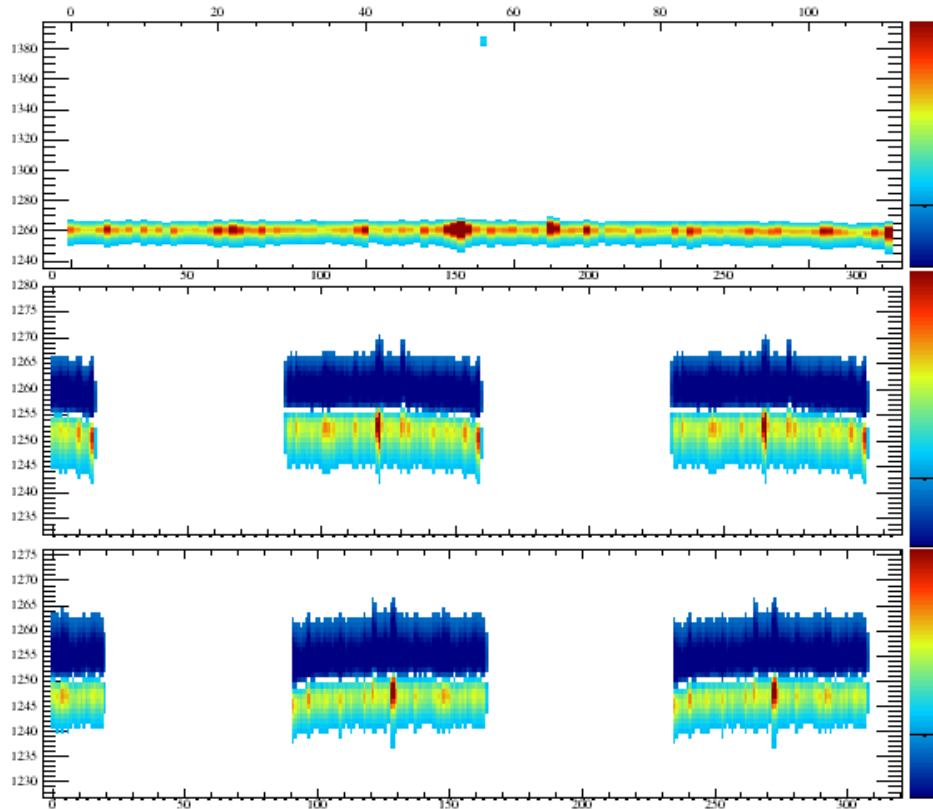

APA Organization

TPC 6, TPC 7	TPC 4, TPC 5	TPC 0, TPC 1
	TPC 2, TPC 3	

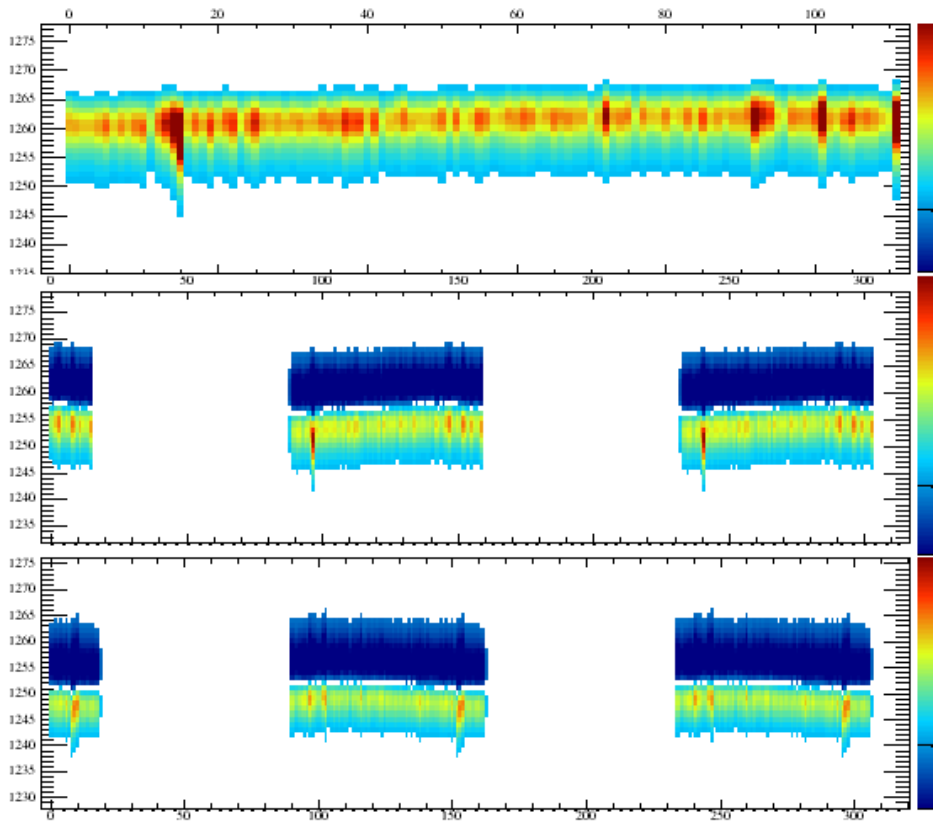

No SCE

**30X SCE
(500 V/cm)**

1X SCE
(500 V/cm)

1X SCE
(250 V/cm)

- ◆ **SpaCE** – use to study space charge effect and produce SCE distortions throughout a TPC
 - Stand-alone C++ code with ROOT/ALGLIB libraries
- ◆ Incorporated simulations into **LArSoft**, which have now been extended to 35-ton
 - Multiple drift E fields supported (250, 300, 350, 400, 450, 500 V/cm)
 - Excludes drift volumes with especially short maximal drift length (hard cut at **50 cm**) – for DUNE 35-ton, this means four out of eight TPC's are excluded
 - See **feature/mrmooney_spacechargeupdate**
 - Packages: larsim, larevt, dunetpc
- ◆ Very simple to turn on SCE in your FHICL file:
 - **services.user.LArG4Parameters.EnableSCE = true**

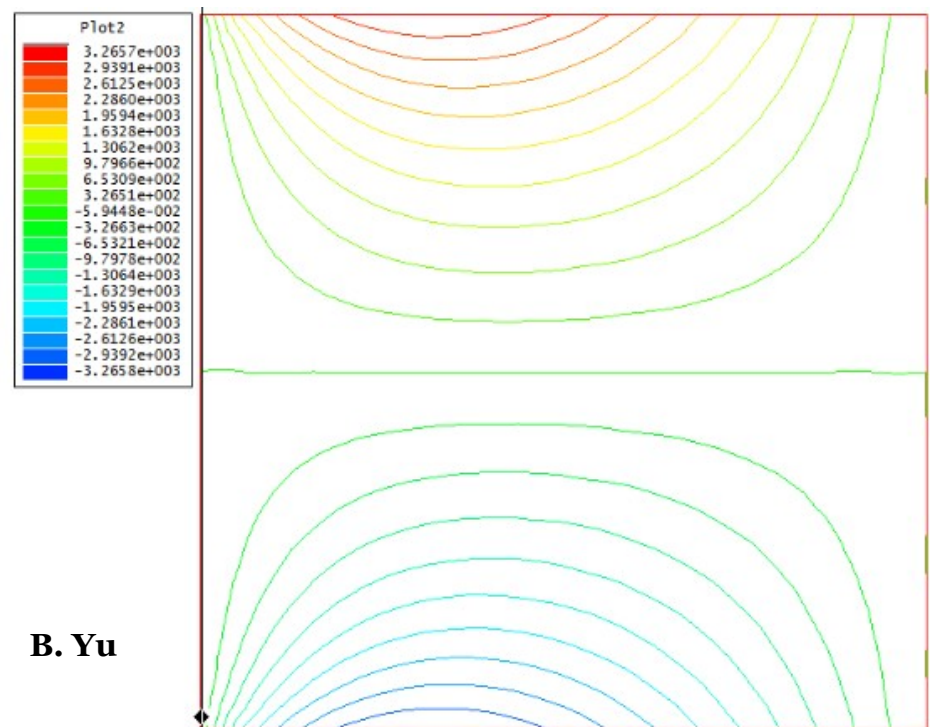

BACKUP SLIDES

- ◆ Visualization of impact on E field (Bo Yu's Maxwell-2D studies)
- ◆ Assumptions:
 - Constant charge deposition rate throughout detector
 - No liquid argon flow – **serious complication**

Drift Direction

Lateral Directions

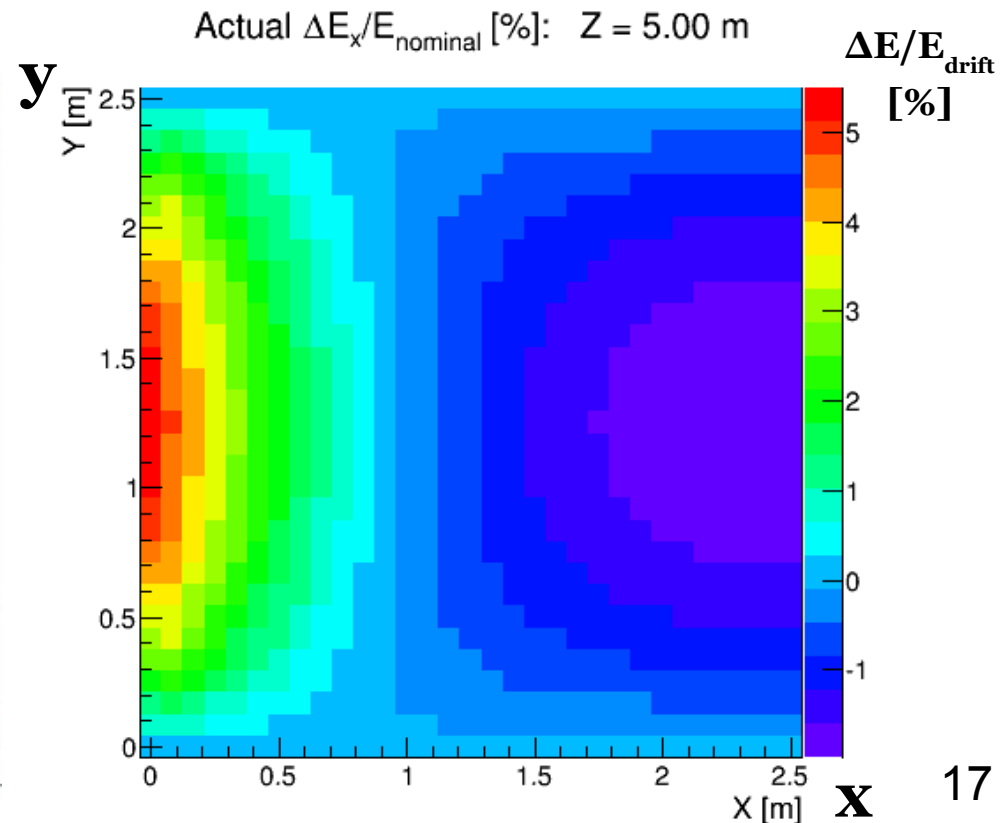

B. Yu

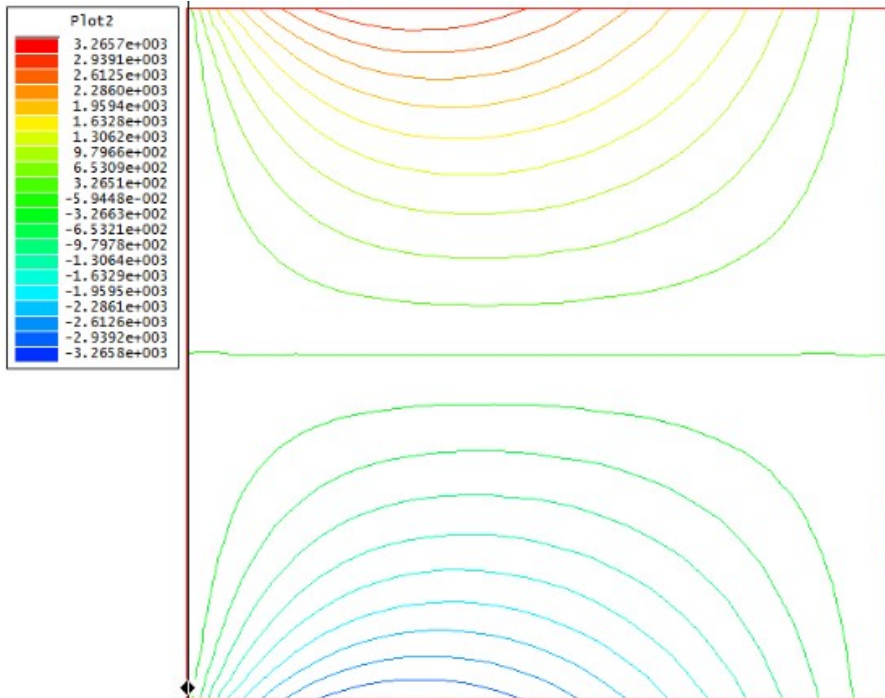

- ◆ Two separate effects on reconstructed **tracks**:
 - Ⓐ • Reconstructed track shortens laterally (looks rotated)
 - Ⓑ • Reconstructed track bows toward cathode (greater effect near center of detector)
- ◆ Can obtain straight track (or multiple-scattering track) by applying corrections derived from data-driven calibration

- ◆ Looking at central z slice ($z = 5$ m) in x-y plane
- ◆ Very good shape agreement compared to Bo's 2D FE (Finite Element) studies
- ◆ Normalization differences understood (using different rate)

- ◆ Looking at central z slice ($z = 5$ m) in x-y plane
- ◆ Very good shape agreement here as well
 - Parity flip due to difference in definition of coordinate system

- ◆ Compare 30 x 30 x 120 field calculation (left) to 15 x 15 x 60 field calculation with interpolation (right)
- ◆ Include analytical continuation of solution points **beyond** boundaries in model – improves performance near edges

Actual $\Delta E_x/E_{\text{nominal}}$ [%]: Z = 5.00 m

Interpolated $\Delta E_x/E_{\text{nominal}}$ [%]: Z = 5.00 m

- ◆ Example: track placed at $x = 1 \text{ m}$ (anode at $x = 2.5 \text{ m}$)
 - $z = 5 \text{ m}, y = [0, 2.5] \text{ m}$

Track Ionization Electrons: X Reconstruction

Track Ionization Electrons: Y Reconstruction

Sample “Cosmic Event”

**Nominal Drift
Field**

500 V/cm

**Half Drift
Field**

250 V/cm

- ◆ Not accounting for non-uniform charge deposition rate in detector → significant modification?
- ◆ Flow of liquid argon → likely significant effect!
 - Previous flow studies in 2D... differences in 3D?
 - Time dependencies?

No Flow**Flow w/o Turbulence****Flow w/ Turbulence**

Example: E_x Convergence in x-y Plane ($z = 5$ m)

E_x Convergence: (X,Y,Z) = (0.25 m, 2.00 m, 5.00 m)

$y = 2$ m

E_x Convergence: (X,Y,Z) = (1.25 m, 2.00 m, 5.00 m)

E_x Convergence: (X,Y,Z) = (2.00 m, 2.00 m, 5.00 m)

E_x Convergence: (X,Y,Z) = (0.25 m, 1.25 m, 5.00 m)

$y = 1.25$ m

E_x Convergence: (X,Y,Z) = (1.25 m, 1.25 m, 5.00 m)

E_x Convergence: (X,Y,Z) = (2.00 m, 1.25 m, 5.00 m)

E_x Convergence: (X,Y,Z) = (0.25 m, 0.25 m, 5.00 m)

$y = 0.25$ m

E_x Convergence: (X,Y,Z) = (1.25 m, 0.25 m, 5.00 m)

E_x Convergence: (X,Y,Z) = (2.00 m, 0.25 m, 5.00 m)

$x = 0.25$ m

$x = 1.25$ m

$x = 2$ m

Estimation of ΔE_x (Z = 5.00 m)

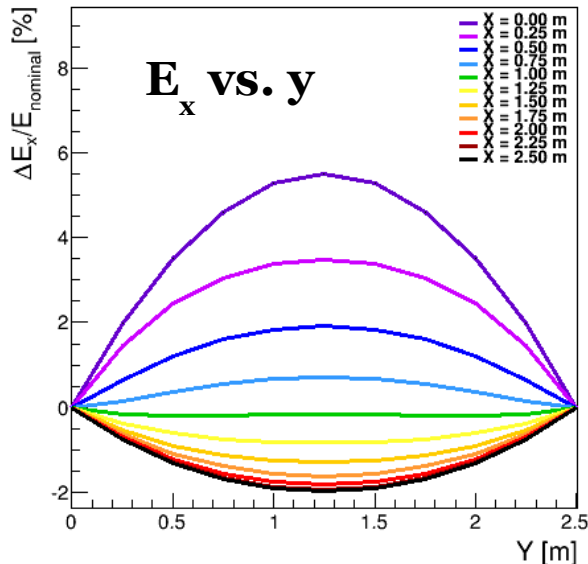

Absolute Uncertainty on ΔE_x Estimation (Z = 5.00 m)

Relative Uncertainty on ΔE_x Estimation (Z = 5.00 m)

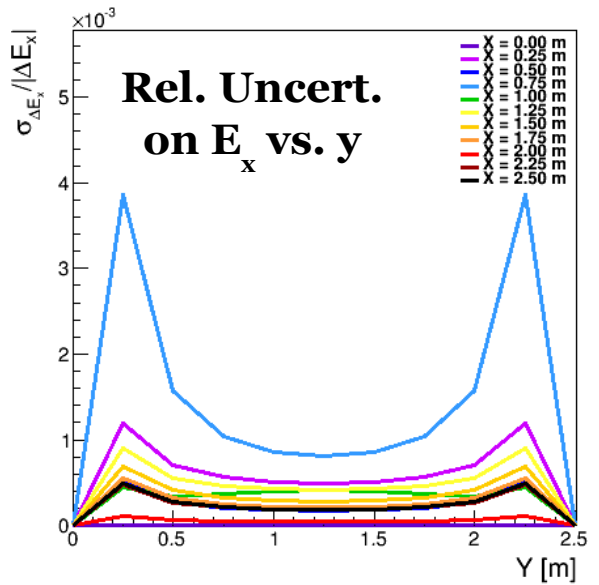

Estimation of ΔE_x (Z = 5.00 m)

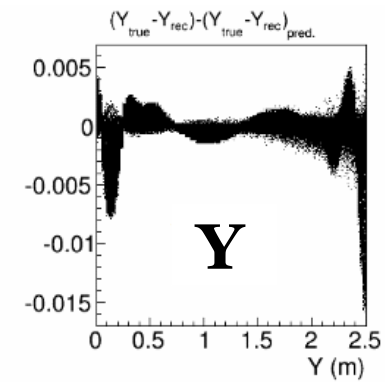

Absolute Uncertainty on ΔE_x Estimation (Z = 5.00 m)

Relative Uncertainty on ΔE_x Estimation (Z = 5.00 m)

Residuals of Forward Transportation (Uncert. in Simulation of Effect)

Impact of Space Charge Effect (Reconstruction Bias)

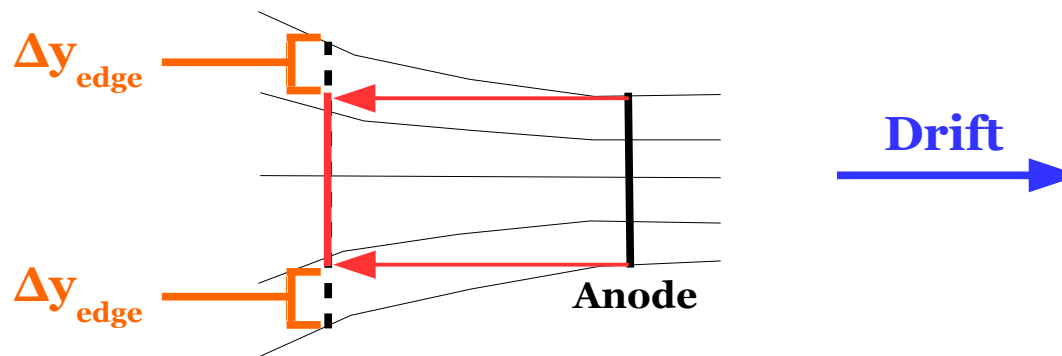

Residuals of Backward Transportation (Post-bias-correction Uncert. for Perfect Calibration)

Reality: these will be larger!

- ◆ Can use cosmic muon tracks for calibration
 - Possibly sample smaller time scales more relevant for a particular neutrino-crossing time slice
 - Minimally: data-driven cross-check against laser system calibration
- ◆ **Smoking-gun test:** see lateral charge displacement at track ends of non-contained cosmic muons → space charge effect!
 - No timing offset at transverse detector faces (no E_x distortions)
 - Most obvious feature of space charge effect
