

Jet Substructure at the LHC: New Observables and New Calculations

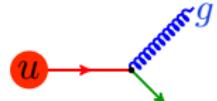

Ian Moult

Berkeley Center for Theoretical Physics
Lawrence Berkeley Laboratory

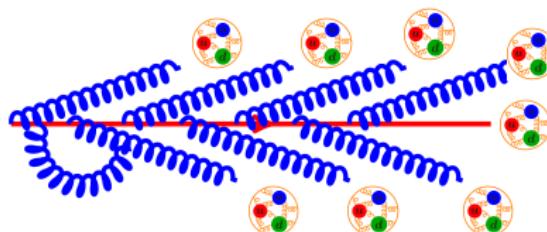

QCD

- QCD is an $SU(3)$ gauge theory:

$$\mathcal{L}_{\text{QCD}} = -\frac{1}{4} G_{\mu\nu}^a G^{\mu\nu a} + \sum_f \bar{q}_f (i \not{D} - m_f) q_f$$

- Microscopic degrees of freedom are quarks and gluons.
- In scattering experiments we observe collimated sprays of hadrons, called jets:

- Jets act as proxies for quarks and gluons.
- Jets are our probe of the underlying microscopic dynamics.

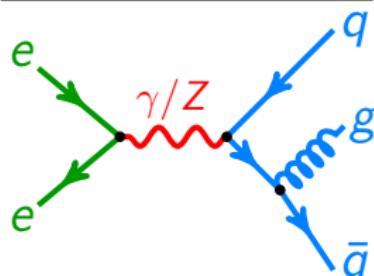

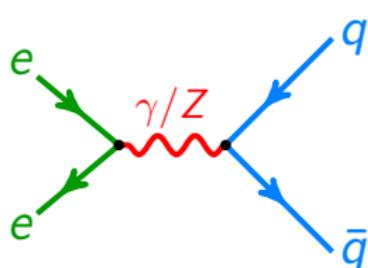

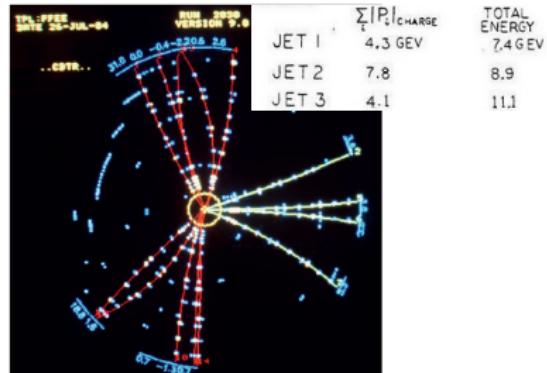

Jets at PETRA

- Kinematics of jets used to infer gluon emission in hard scattering.

2-Jet Event

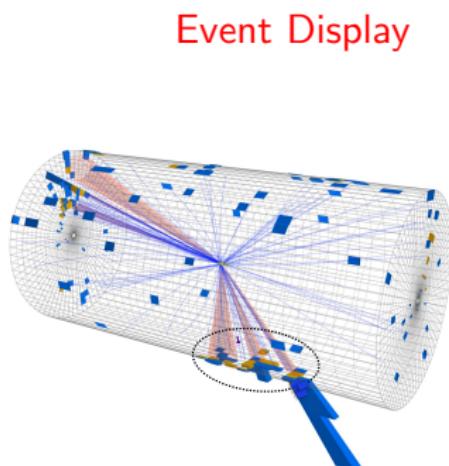

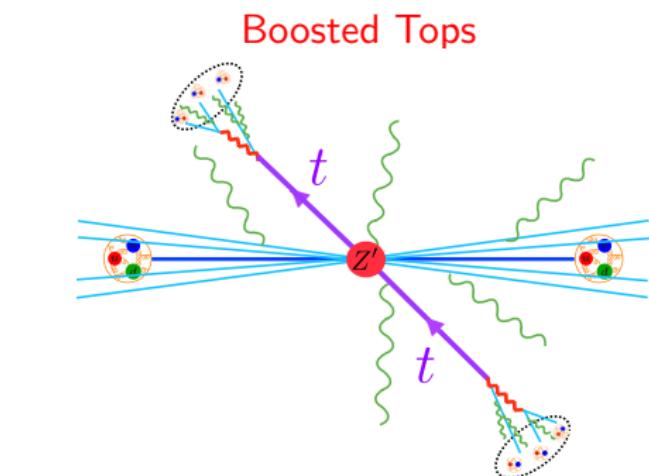

3-Jet Event

Jets at the LHC: Internal Structure

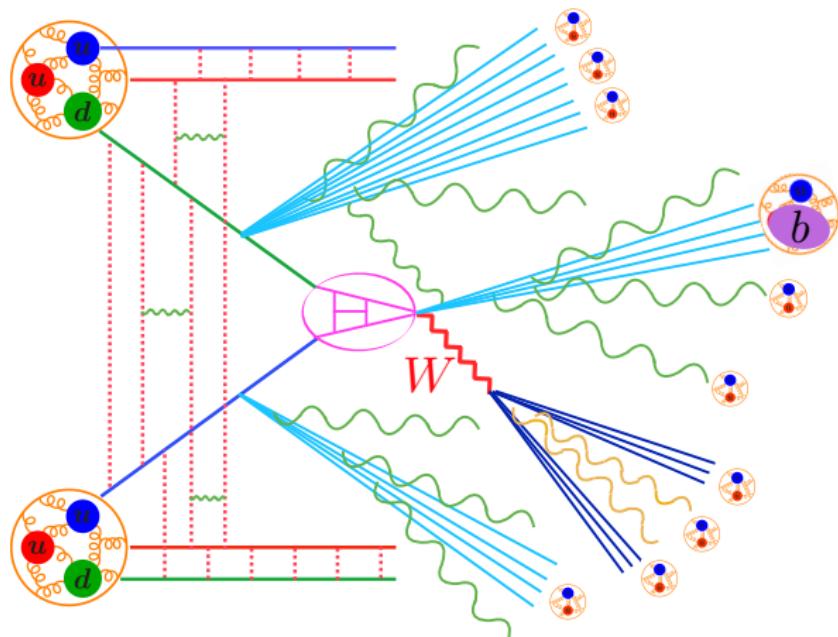

- Internal structure of jets resolved due to excellent detector resolution.
- Electroweak scale objects, $W/Z/H$ or t can have sufficiently high p_T to appear inside a jet.

- Revolutionizes the types of questions we can/must ask about jets:
 \Rightarrow jets have substructure!

A Theorists View

- Very complicated structure!

$Q \sim \text{TeV}$

$p_{TJ} \sim 500 \text{ GeV}$

$m_J \sim 100 \text{ GeV}$

$m_J^2/p_{TJ} \sim 20 \text{ GeV}$

$m_b \sim 4 \text{ GeV}$

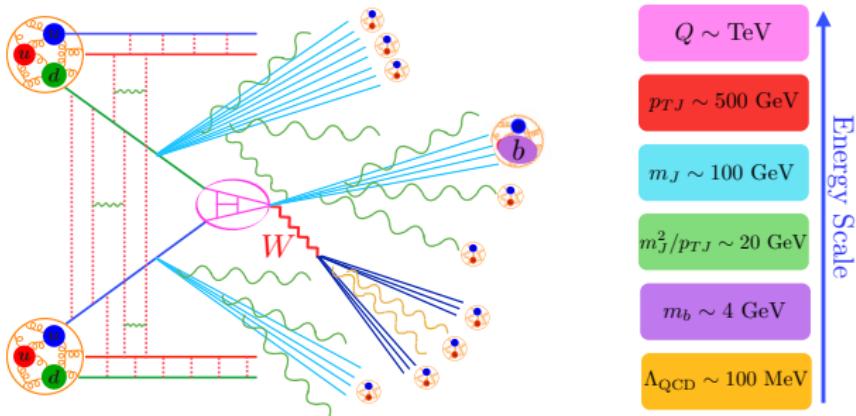

$\Lambda_{\text{QCD}} \sim 100 \text{ MeV}$

- Involves interactions at many hierarchical energy scales.

A Theorist's View

- Tractable due to factorization:

$$\frac{d\sigma}{d\mathcal{M}_1 \dots} = \sum_{\{\kappa\}} \text{tr} H_\kappa I I J_{\kappa_i} \otimes \dots \otimes J_{\kappa_j} S_{\kappa_s} \otimes f_{p/i} f_{p/j} \otimes f_{k \rightarrow H} \otimes \dots \otimes f_{l \rightarrow H} \otimes F + \dots$$

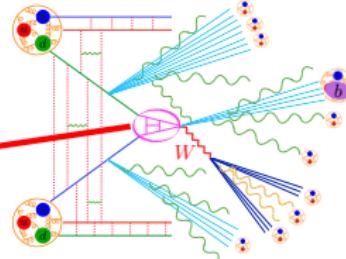

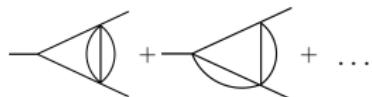

- $\frac{d\sigma}{d\mathcal{M}_1 \dots}$ written as a convolution of single scale objects.
- High energy dynamics integrated out, replaced by sources.
- Convenient formulation in effective field theory.

Recent Progress

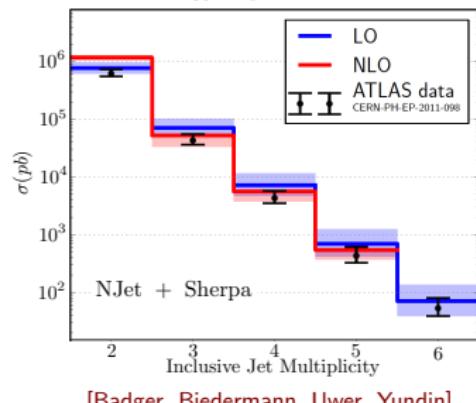

- Significant recent progress in description of more complex final states.

- Hard Scattering: H_κ

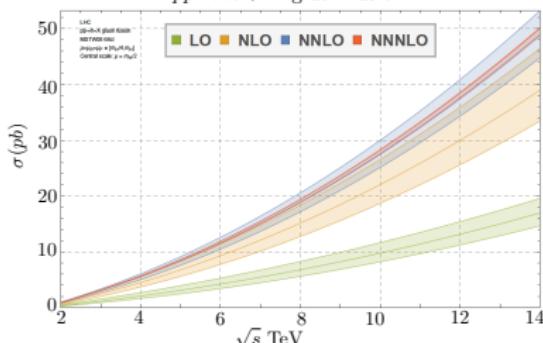

More Legs

$pp \rightarrow \text{jets at } 7 \text{ TeV}$

More Loops

$pp \rightarrow h + X$ gluon fusion

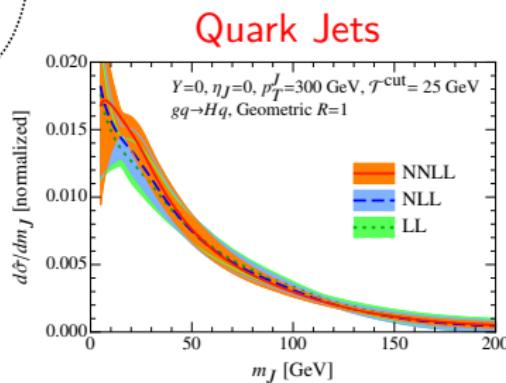

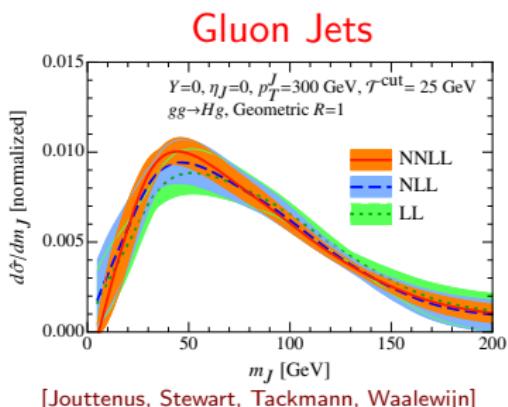

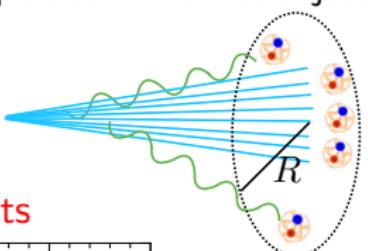

Anastasiou, Duhr, Dulat, Herzog, Mistlberger

Gehrmann et al.; Baikov et al.

Recent Progress

- Significant recent progress in description of more complex final states.
 - Dynamics of QCD radiation (SCET):
 $\mathcal{I} \mathcal{J}_{\kappa_i} \times \cdots \times \mathcal{J}_{\kappa_j} \otimes \mathcal{S}_{\kappa_s} \otimes \mathcal{F}$
 - Calculate properties of individual jets.

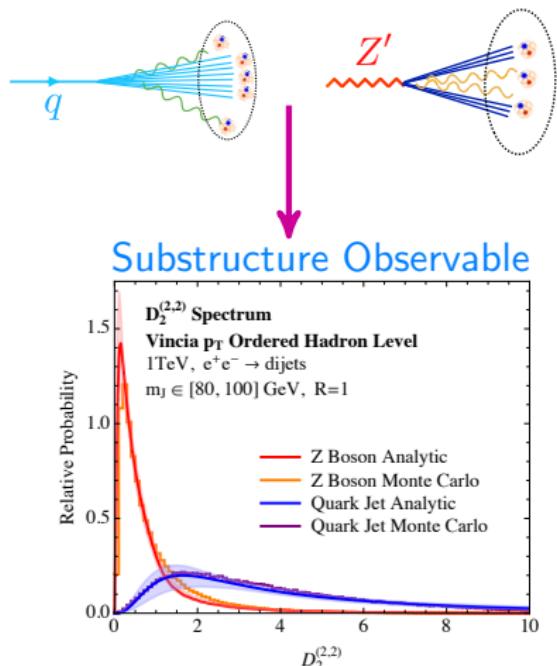

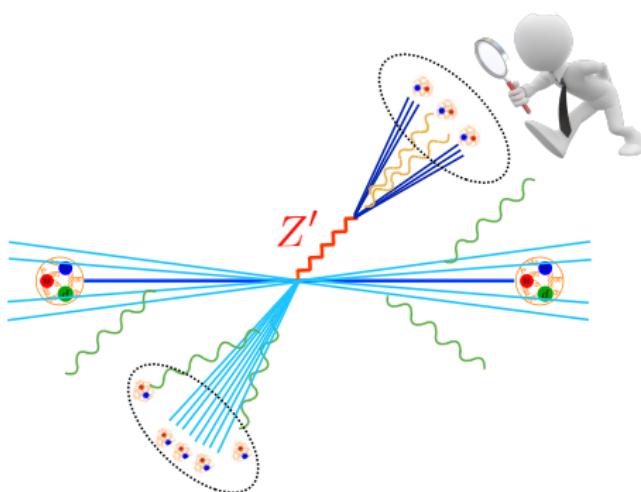

$$m_J^2 = \sum_{i,j \in J} p_i \cdot p_j$$

[Jouttenus, Stewart, Tackmann, Waalewijn]

Jet Substructure

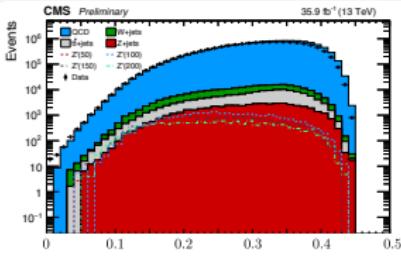

- What if I want to look inside a jet?

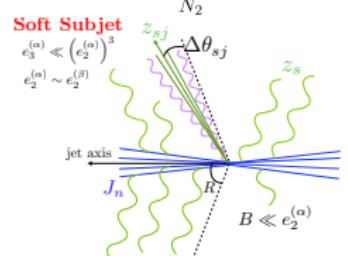

- **Jet substructure:** measure properties (charge, energy, etc) of radiation in a jet to extract information about its origin.

Outline

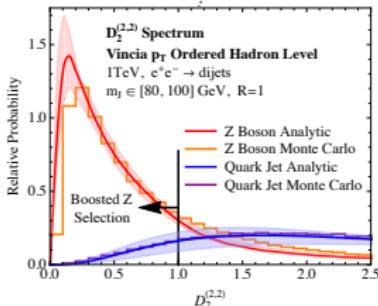

- New Observables for Jet Substructure

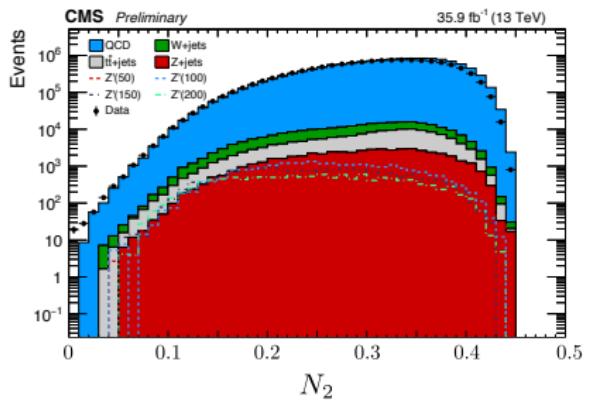

- Effective Field Theories for Jet Substructure

- Analytic Calculations for Jet Substructure

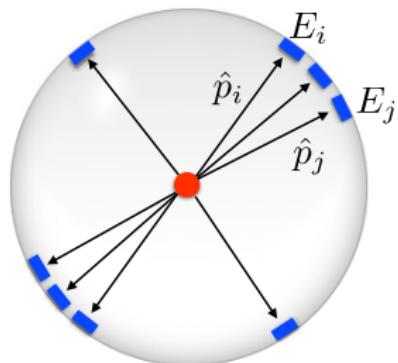

New Observables for Jet Substructure

Back to Basics

- What is an observable?

$$F_N(P) = \sum E_{i_1} \cdots E_{i_N} f_N(\hat{p}_{i_1}, \dots, \hat{p}_{i_N})$$

- Linear in the energies by Infrared and Collinear (IRC) safety.
- f_N is symmetric, and $f_N \rightarrow 0$ if $\hat{p}_i \parallel \hat{p}_j$

- Known that from this one can reconstruct any IRC safe observable.
- Is this useful for jet substructure?
 \implies Need to choose a basis.

Generalized Energy Correlation Functions

General Energy Correlation Functions

$$R_{ij} = \sqrt{\Delta y_{ij}^2 + \Delta \phi_{ij}^2}$$

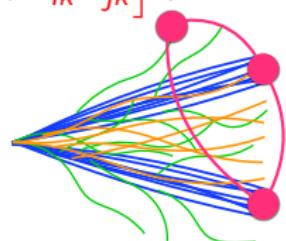

$$ie_j^{(\beta)} = \frac{1}{p_{TJ}^j} \sum_{1 \leq n_1 < \dots < n_j \leq n} p_{Tn_1} p_{Tn_2} \dots p_{Tn_j} \min \left(\prod_{s,t}^i R_{st}^\beta \right)$$

- Example: Three different ways to probe three particle correlations.

$${}_1e_3^{(\beta)} = \frac{1}{p_{TJ}^3} \sum_{1 \leq i < j < k \leq n_J} p_{Ti} p_{Tj} p_{Tk} \min \left[R_{ij}^\beta, R_{ik}^\beta, R_{jk}^\beta \right],$$

$${}_2e_3^{(\beta)} = \frac{1}{p_{TJ}^3} \sum_{1 \leq i < j < k \leq n_J} p_{Ti} p_{Tj} p_{Tk} \min \left[R_{ij}^\beta R_{ik}^\beta, R_{ij}^\beta R_{jk}^\beta, R_{ik}^\beta R_{jk}^\beta \right],$$

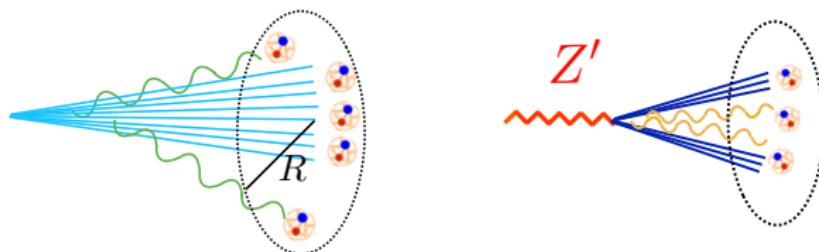

$${}_3e_3^{(\beta)} = \frac{1}{p_{TJ}^3} \sum_{1 \leq i < j < k \leq n_J} p_{Ti} p_{Tj} p_{Tk} R_{ij}^\beta R_{ik}^\beta R_{jk}^\beta = e_3^{(\beta)}$$

- Flexible basis for substructure observables.

Power Counting Observables

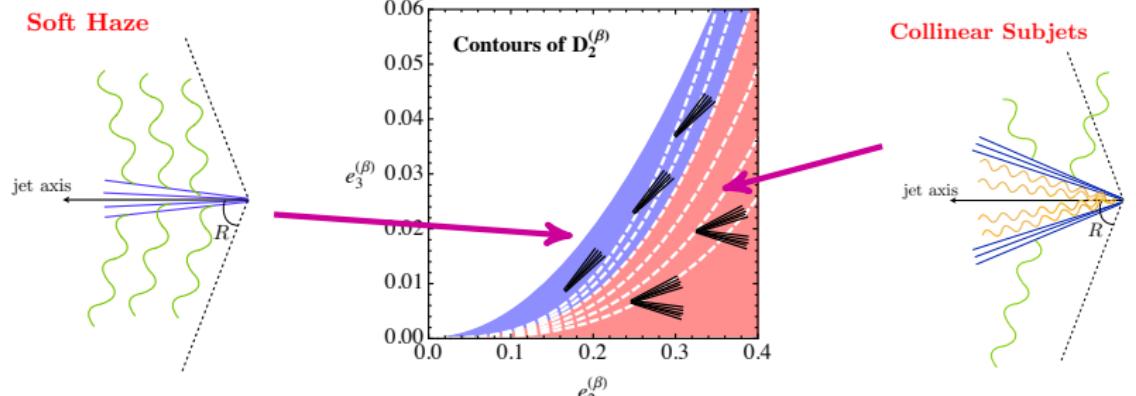

- How can we combine these observables to identify features of a jet?
- Example: Boosted $W/Z/H$ discrimination:

- ① Write down Effective Field Theory (EFT) description of each configuration.
- ② Identify region of validity of EFTs in terms of observables $i e_j^{(\beta)}$.
- ③ Shared boundaries define how to separate.

Power Counting Observables: D_2

- Consider using $e_2^{(\beta)}$, $e_3^{(\beta)}$.
- Phase space separated by contours of $D_2^{(\beta)}$: $e_3^{(\beta)} = D_2^{(\beta)} \left(e_2^{(\beta)} \right)^3$

$$\left(e_2^{(\beta)} \right)^3 < e_3^{(\beta)} < \left(e_2^{(\beta)} \right)^2$$

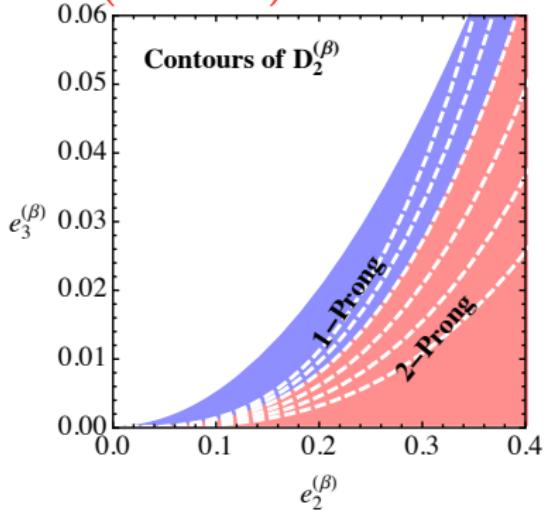

$$e_3^{(\beta)} < \left(e_2^{(\beta)} \right)^3$$

Phase Space

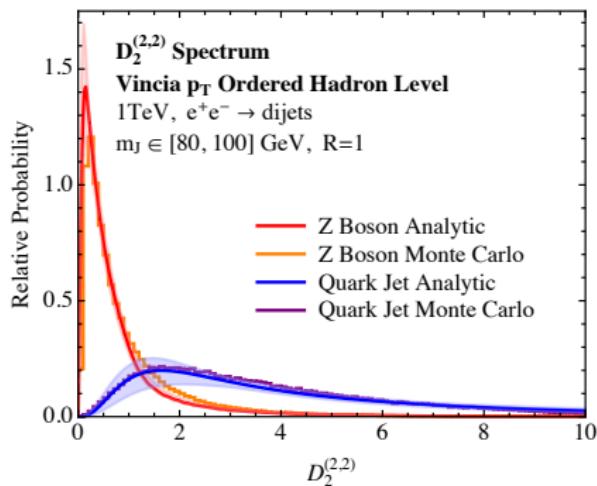

- Define the discriminant

$$D_2^{(\beta)} = \frac{e_3^{(\beta)}}{\left(e_2^{(\beta)}\right)^3} = \frac{\text{[Diagram showing two overlapping phase space regions with red dots representing points and blue lines representing boundaries]}}{\left(\text{[Diagram showing two overlapping phase space regions with red dots representing points and blue lines representing boundaries]}\right)^3}}$$

$(e_2^{(\beta)}, e_3^{(\beta)})$ Phase Space

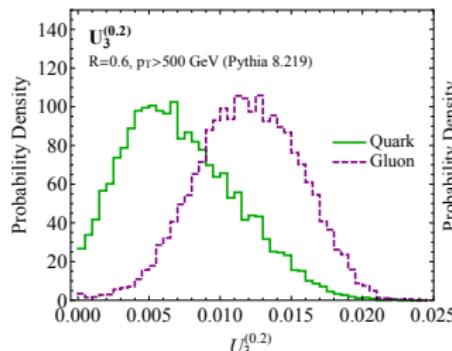

D_2 Spectrum

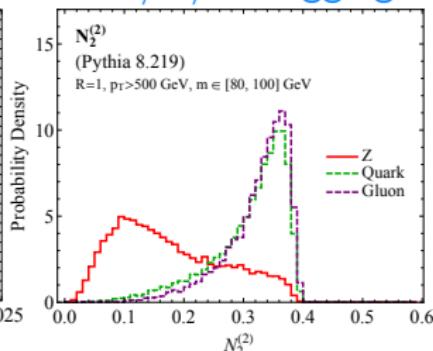

Summarizing the Observables

- Observables can be designed for a variety of purposes

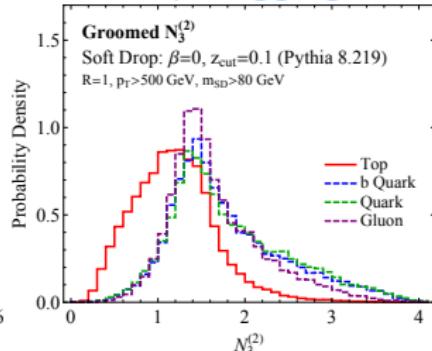

Quark vs. Gluon

$W/Z/H$ Tagging

Top Tagging

- Focus on $W/Z/H$:

Searches at ATLAS

$$D_2^{(\beta)} = \frac{e_3^{(\beta)}}{\left(e_2^{(\beta)}\right)^3} = \frac{\text{[Diagram showing two overlapping cones with red and blue lines]}}{\left(\text{[Diagram showing two overlapping cones with red and blue lines]}\right)^3}$$

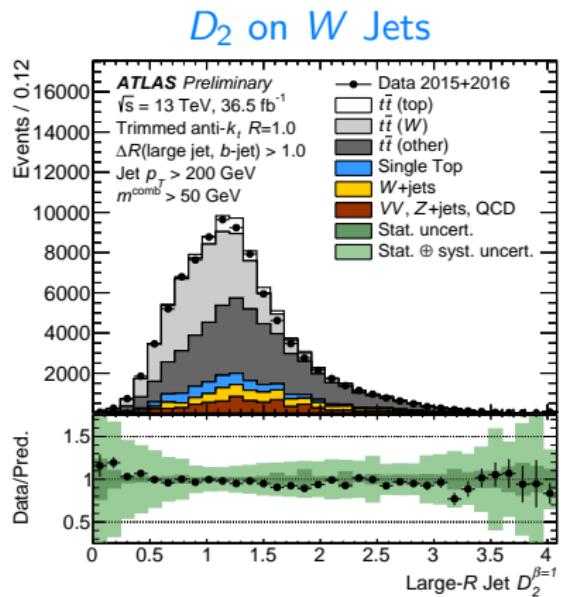

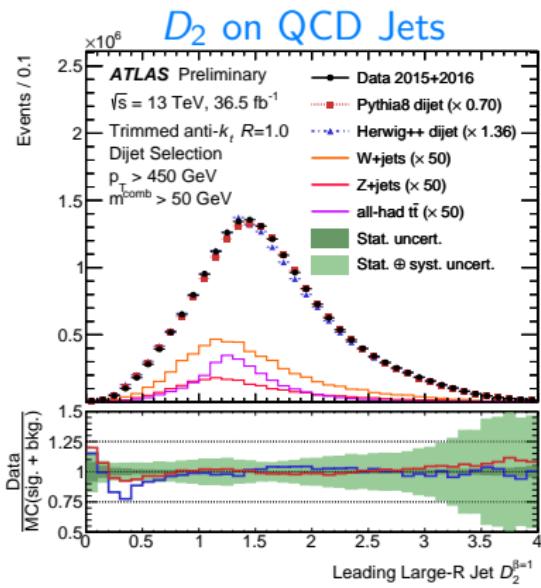

Searches at CMS

$$N_2^{(\beta)} = \frac{2e_3^{(\beta)}}{\left(e_2^{(\beta)}\right)^2} \frac{\text{[Diagram showing two overlapping cones with red and blue lines]}}{\left(\text{[Diagram showing two overlapping cones with red and blue lines]}\right)^3}$$

The Shape of Jets at the LHC: D_2

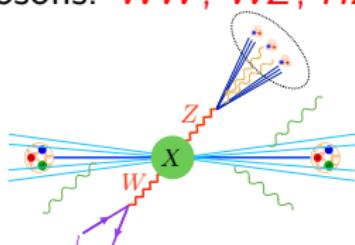

- D_2 is default tagger for ATLAS.

$$D_2^{(\beta)} = \frac{e_3^{(\beta)}}{\left(e_2^{(\beta)}\right)^3} = \frac{\text{[diagram of three jets with varying shapes]}}{\left(\text{[diagram of three narrow jets]}^3\right)}$$

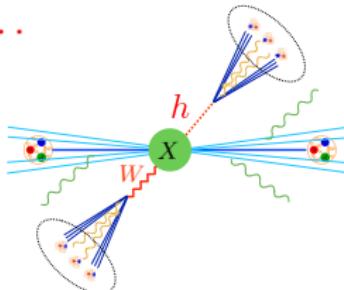

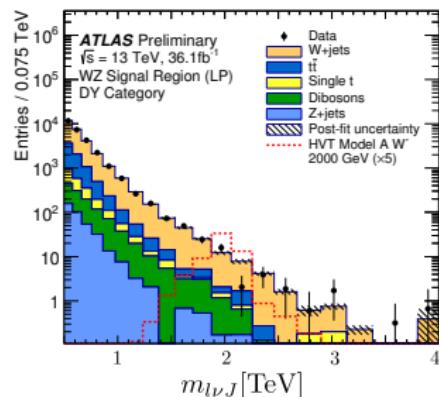

Applications: High Mass Resonances

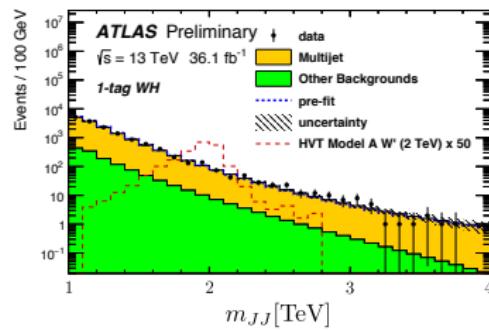

- Particular interest in possibility of high mass resonances decaying to dibosons: WW , WZ , HZ , $\gamma\gamma$, γZ , ...

WZ Diboson Invariant Mass

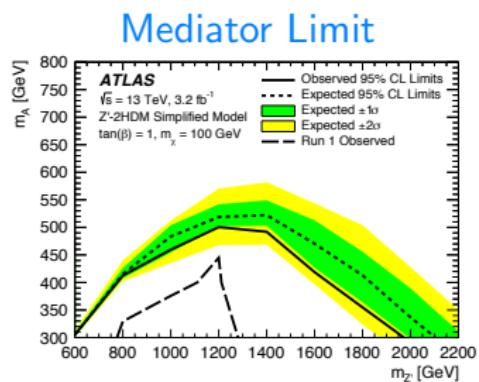

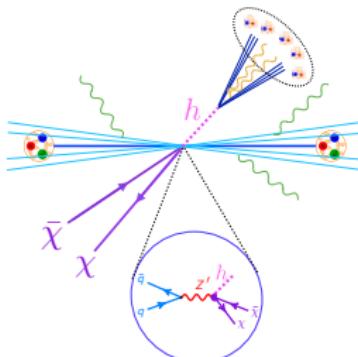

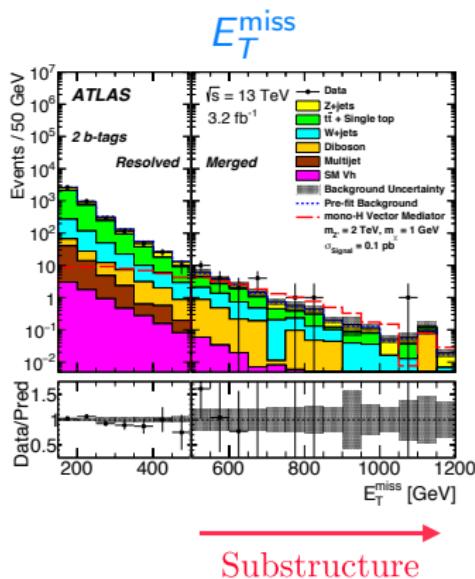

WH Diboson Invariant Mass

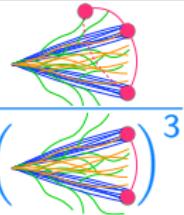

Applications: Dark Matter Searches

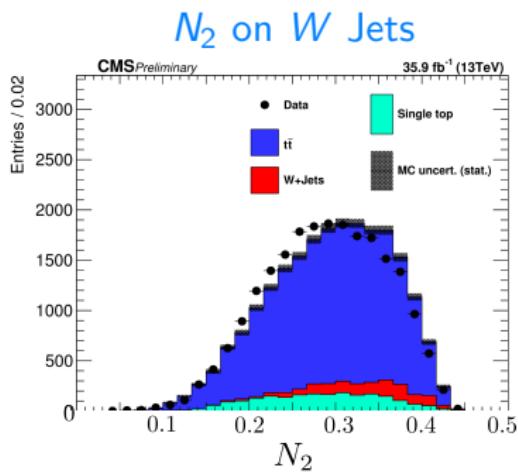

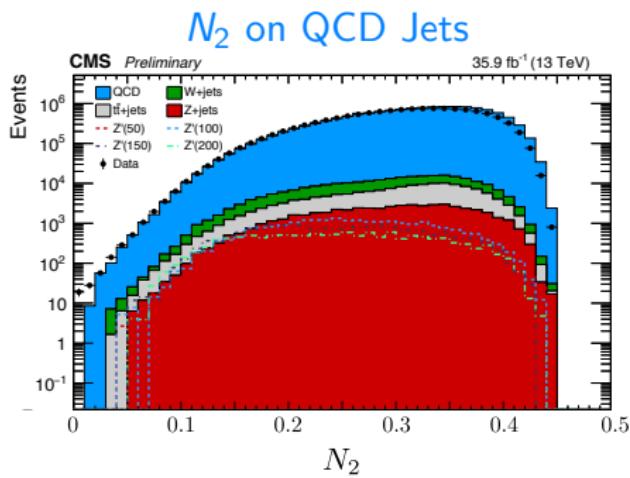

- Dark Matter Searches:

N_2 at CMS

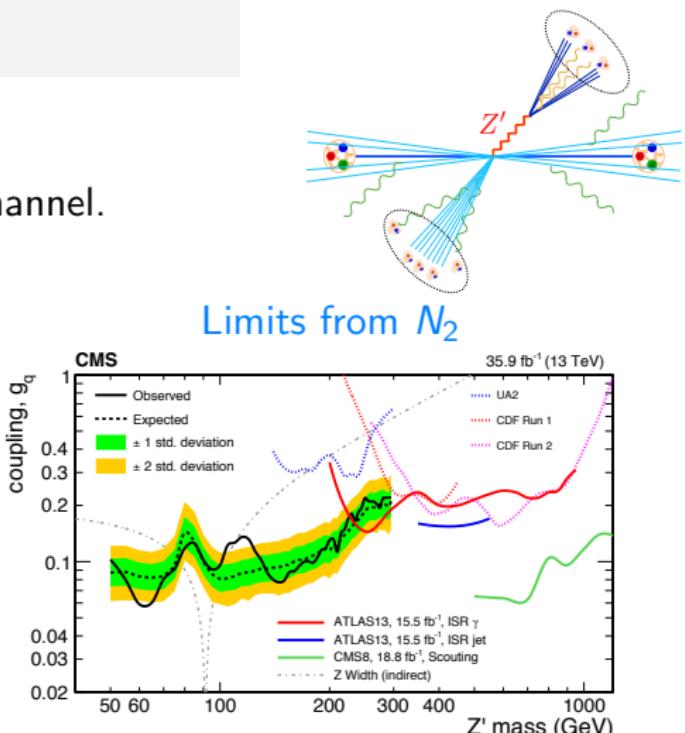

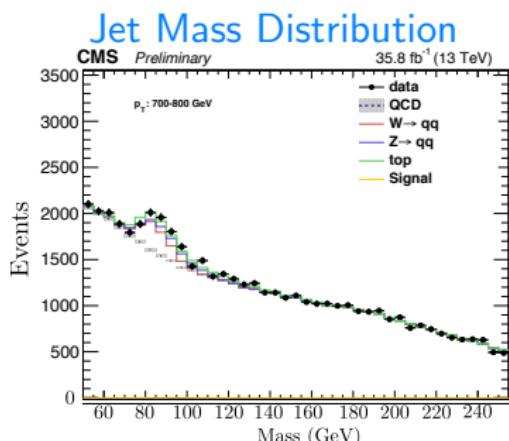

- N_2 measured by CMS.

$$N_2^{(\beta)} = \frac{2e_3^{(\beta)}}{(e_2^{(\beta)})^2} \left(\frac{e_3^{(\beta)}}{e_2^{(\beta)}} \right)^3$$

Low Mass Searches

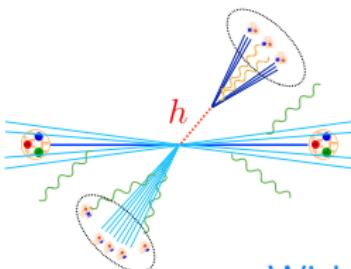

- Low mass Z' search in dijet channel.

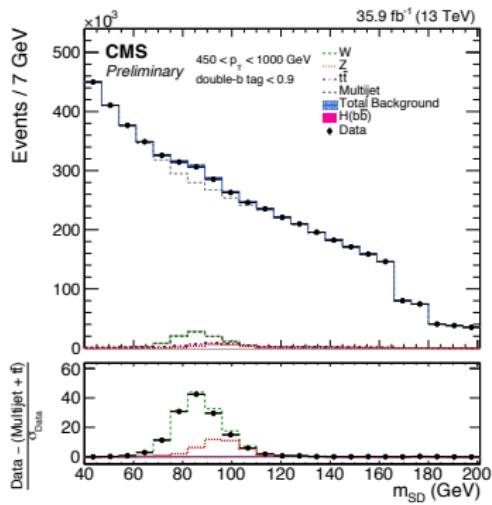

- Find $Z' = Z/W!$
- Probe new low mass, low x-sec region of parameter space!

Applications: $H \rightarrow b\bar{b}$

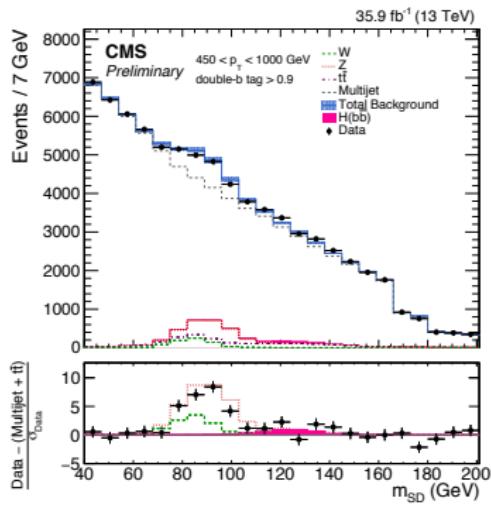

- Towards boosted $H \rightarrow b\bar{b}$.

With b -tag

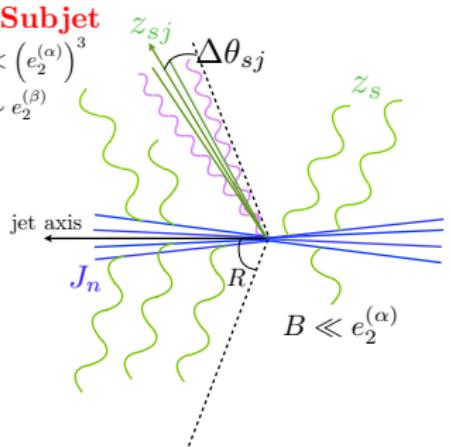

Effective Field Theory Frameworks for Jet Substructure

Soft Subjet

$$e_3^{(\alpha)} \ll (e_2^{(\alpha)})^3$$

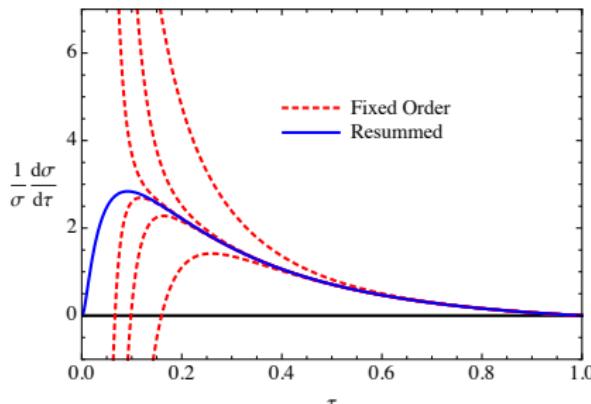

$$e_2^{(\alpha)} \sim e_2^{(\beta)}$$

A Standard QCD Calculation

- QCD has soft and collinear singularities.
- If one measures an observable τ on a jet,

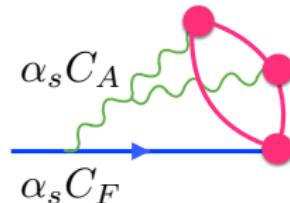

$$\begin{aligned}\frac{d\sigma}{d\tau} &= -\frac{2\alpha_s C_F}{\pi} \frac{\log \tau}{\tau} \left(1 - \frac{\alpha_s C_F \log^2 \tau}{\pi} + \frac{1}{2} \left(\frac{\alpha_s C_F \log^2 \tau}{\pi} \right)^2 - \frac{1}{6} \left(\frac{\alpha_s C_F \log^2 \tau}{\pi} \right)^3 + \dots \right) \\ &= -\frac{2\alpha_s C_F}{\pi} \frac{\log \tau}{\tau} \left(e^{-\frac{\alpha_s C_F \log^2 \tau}{\pi}} \right)\end{aligned}$$

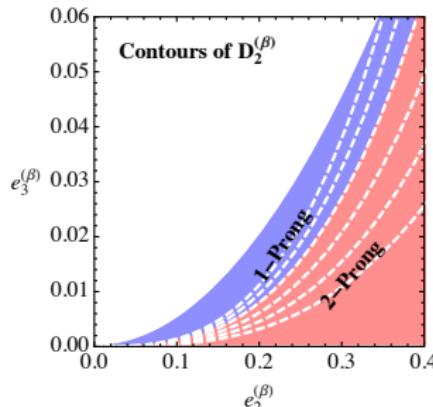

- All orders resummation necessary.

D_2

- Recall $D_2^{(\beta)} = \frac{e_3^{(\beta)}}{(e_2^{(\beta)})^3}$
- First non-zero at two-emissions
- Cross section for D_2 computed by marginalization:

$$\frac{d\sigma}{dD_2} = \int d\mathbf{e}_2^{(\alpha)} d\mathbf{e}_3^{(\alpha)} \delta \left(D_2 - \frac{\mathbf{e}_3^{(\alpha)}}{(\mathbf{e}_2^{(\alpha)})^3} \right) \frac{d\sigma}{d\mathbf{e}_2^{(\alpha)} d\mathbf{e}_3^{(\alpha)}}$$

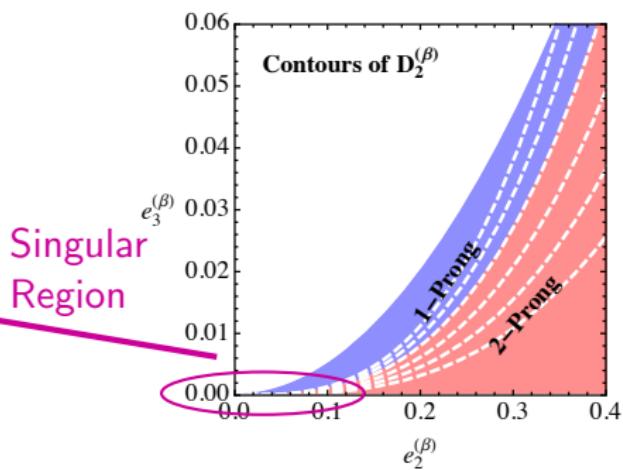

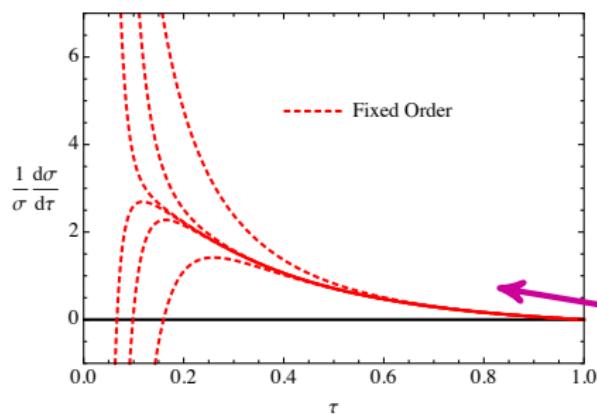

D_2

- Cross section for D_2 computed by marginalization:

$$\frac{d\sigma}{dD_2} = \int d\mathbf{e}_2^{(\alpha)} d\mathbf{e}_3^{(\alpha)} \delta\left(D_2 - \frac{\mathbf{e}_3^{(\alpha)}}{(\mathbf{e}_2^{(\alpha)})^3}\right) \frac{d\sigma}{d\mathbf{e}_2^{(\alpha)} d\mathbf{e}_3^{(\alpha)}}$$

- For each value of D_2 contour of integration passes through singular region of phase space \implies **not computable in fixed order perturbation theory!**

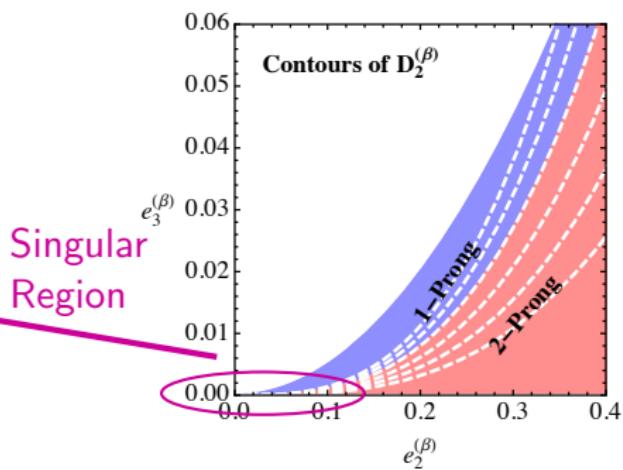

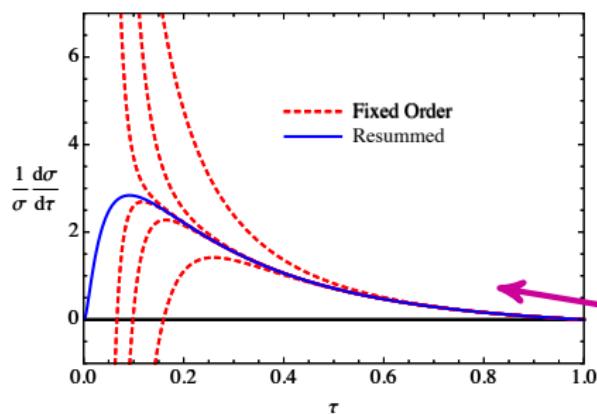

D_2

- Cross section for D_2 computed by marginalization:

$$\frac{d\sigma}{dD_2} = \int d\mathbf{e}_2^{(\alpha)} d\mathbf{e}_3^{(\alpha)} \delta\left(D_2 - \frac{\mathbf{e}_3^{(\alpha)}}{(\mathbf{e}_2^{(\alpha)})^3}\right) \frac{d\sigma}{d\mathbf{e}_2^{(\alpha)} d\mathbf{e}_3^{(\alpha)}}$$

- For each value of D_2 contour of integration passes through singular region of phase space \Rightarrow **not computable in fixed order perturbation theory!**

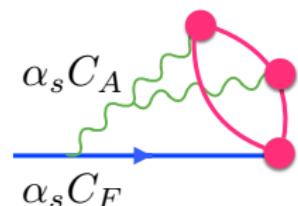

D_2

- D_2 can be computed in resummed perturbation theory.
- Resummation regulates singular region of phase space prior to integration over the contour : **Sudakov Safety**. [Larkoski, Thaler]
- Result starts at α_s and with a single color factor:

$$\frac{d\sigma}{dD_2} \propto \frac{\alpha_s C_F}{\pi} \frac{e^{-\frac{\alpha_s}{\pi} \frac{C_A}{2} \log^2 D_2}}{D_2}$$
$$\propto \frac{\alpha_s C_F}{\pi} \frac{1}{D_2} + \dots$$

?????????

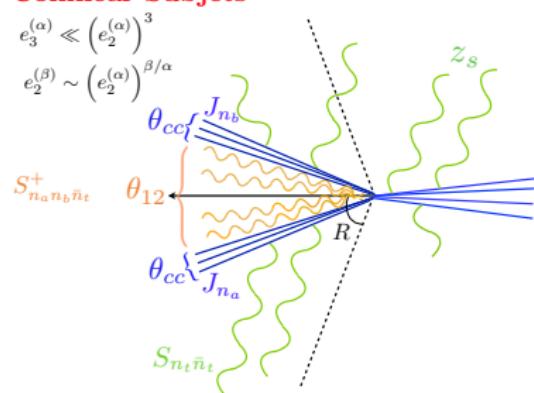

- Other examples exist with $\sqrt{\alpha_s}$ behavior.
- Requires understanding of all order structure of perturbation theory.

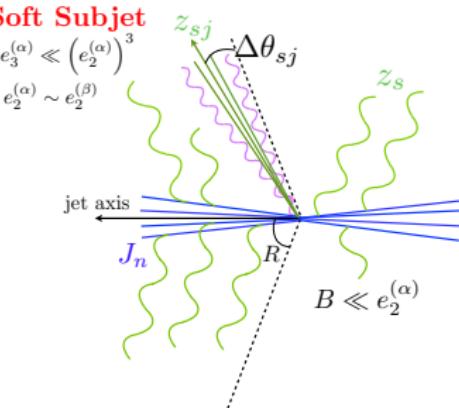

EFTs for Jet Substructure

- Can understand all orders structure using Effective Field Theories.
- Dynamics of subjets iteratively integrated out and replaced by sources (Wilson lines)

Collinear Subjets

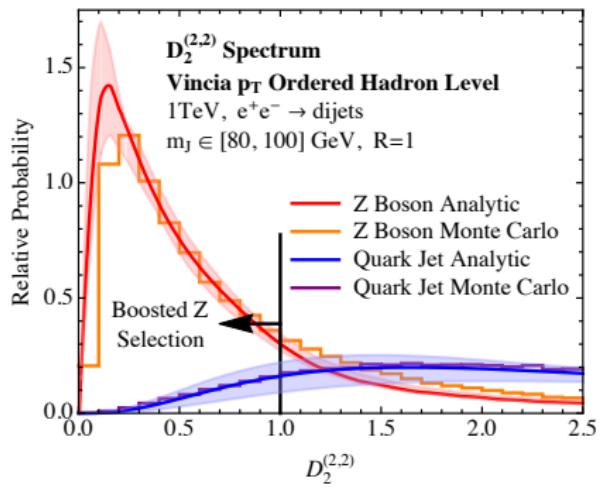

Soft Subjet

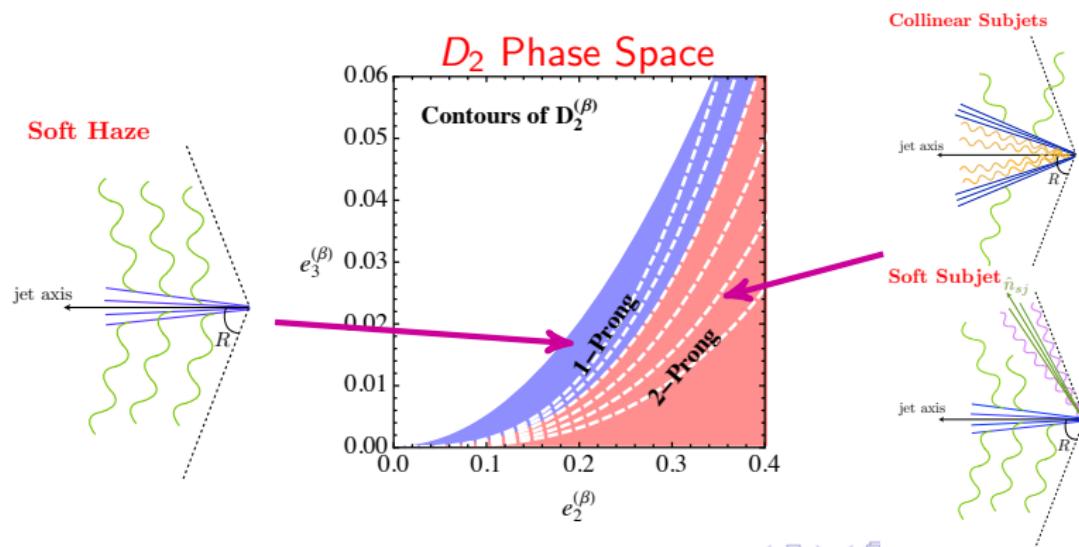

- Powerful approach to describe complicated situations.

Analytic Calculations for Jet Substructure

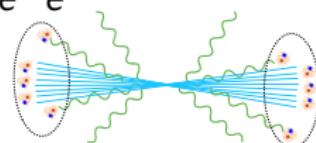

Calculation of D_2

- Set up EFT description in each region of phase space.
- Factorized description of phase space regions can be combined to make prediction for D_2 .

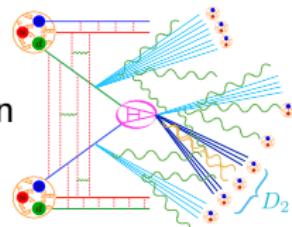

A Warm Up: e^+e^-

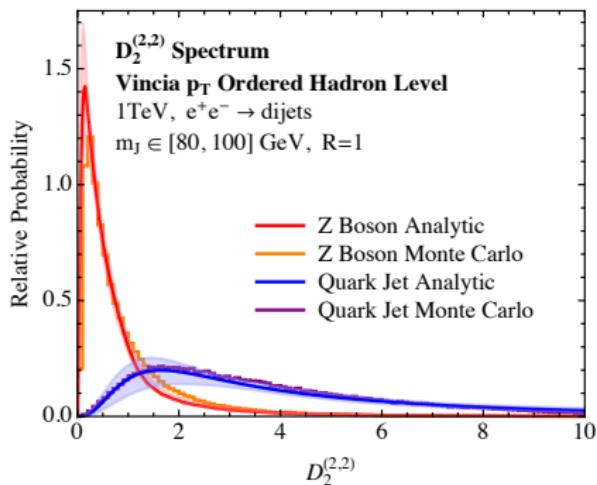

- Warm up with e^+e^-

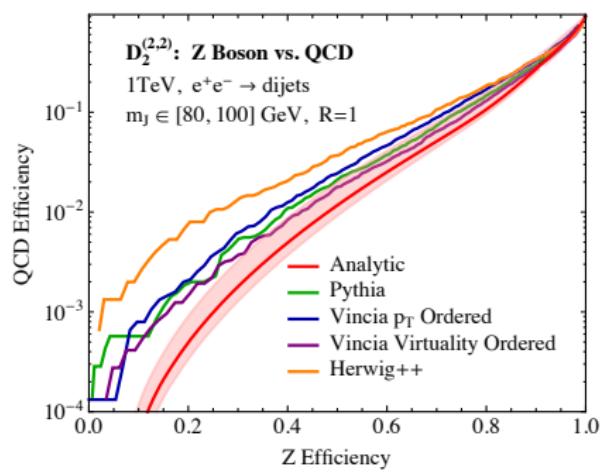

is simpler than

D_2 Spectrum

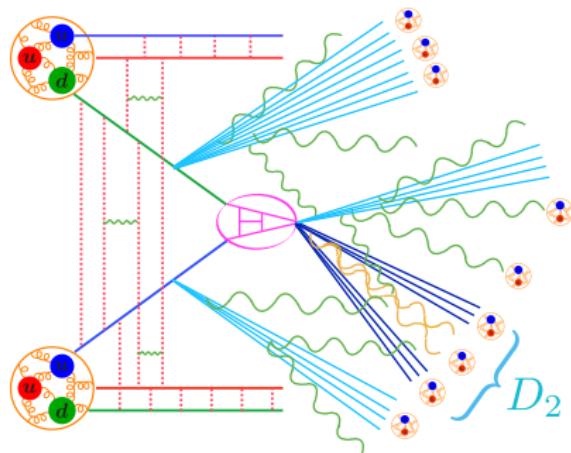

Tagging Efficiency

Analytic Boosted Boson Discrimination at the LHC

- Difficulties in extending to pp :

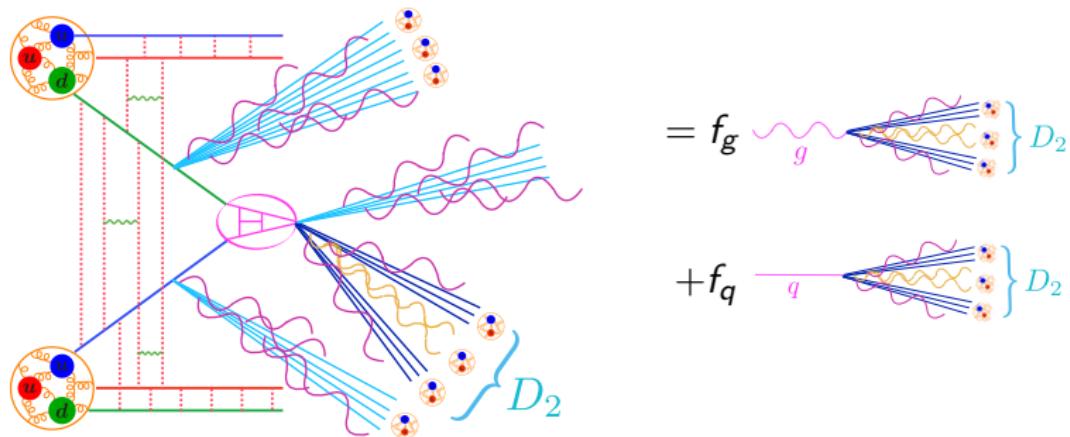

- Global color correlations
- Hadronization corrections
- Pile-Up
- Underlying event

- All complications associated with **soft** radiation.
- Groomers remove **soft** radiation
⇒ Makes calculations simpler and more universal.

Analytic Boosted Boson Discrimination at the LHC

- Grooming removes all color correlations.

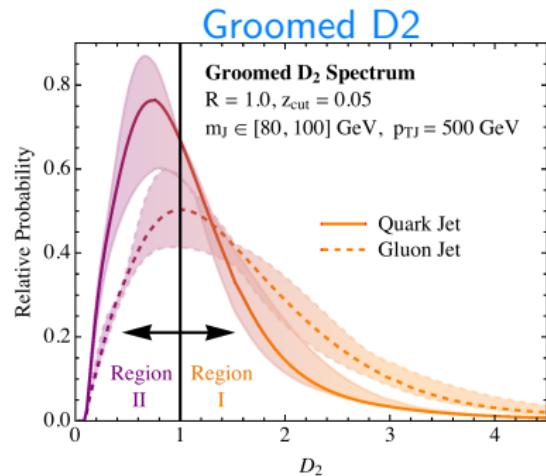

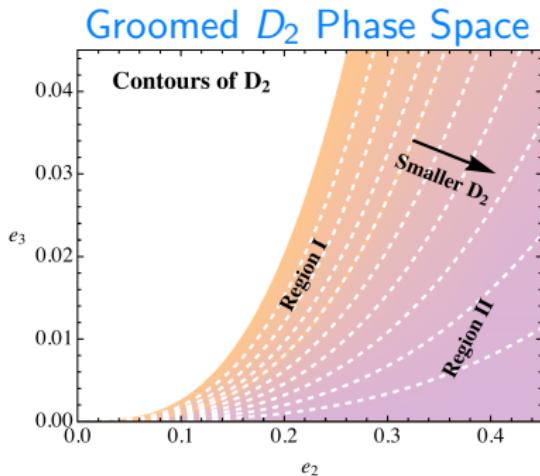

- Jet can be considered in isolation!
- Enables calculations in complicated LHC environment.

Analytic Boosted Boson Discrimination at the LHC

[Larkoski, IM, Neill] Forthcoming

- Calculation of groomed D_2 at the LHC.

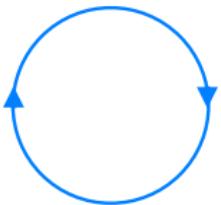

- Analytic understand of modern jet substructure tools at LHC!

Conclusions

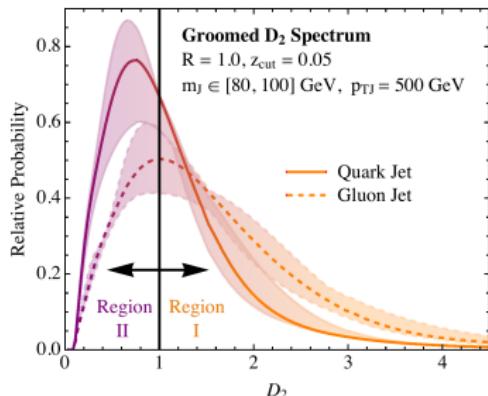

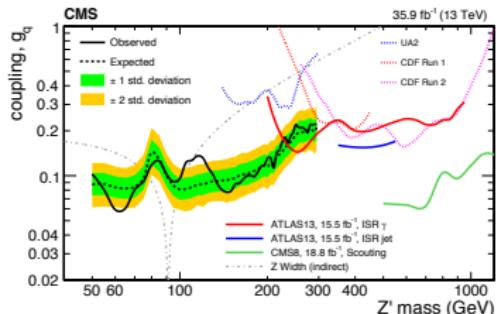

- Jet substructure provides novel ways to test the SM and to search for new physics at the LHC.

More Sophisticated Calculations

More Sophisticated Techniques

- Analytic calculations are a catalyst for further improvements in jet substructure.

Thanks!
