## Are PDFs still consistent with Tevatron data?

*Monday, July 31, 2017 11:55 AM (20 minutes)*

As active data taking has moved to the LHC at CERN, more and more LHC data have been included into fits of parton distribution functions. An anomaly has arisen where formerly excellent agreement between theoretical predictions and experiment in single-top-quark production at the Tevatron is no longer very good. Is this indicative of a deeper issue?
