Nucleon Decay Searches in Super-Kamiokande: Results and Prospects

Gabriel Santucci
2017 August 03
gabriel.santucci@stonybrook.edu

DPF Meeting
Does the Proton Decay?

- Proton stability is not guaranteed by any fundamental symmetry.
- Standard Model interactions share the same structure: gauge theories with unitary symmetry.
- Grand Unified Theories (GUTs) unifies the SM interactions at very high energies (GUT scale) - beyond the reach of accelerators.
- Most GUTs predict nucleon decay with a very long lifetime (> $10^{30}$ years).
- Thus, nucleon decay serves as a direct probe of GUTs. But very massive detectors are necessary for these searches.

Benchmark Modes

\[ p \rightarrow e^+ \pi^0 \]
- non-SUSY favored

\[ p \rightarrow \bar{\nu} K^+ \]
- SUSY favored
GUTs predict many nucleon decay (NDK) modes.

Different experiments have searched for NDK in the 80’s. But no evidence was found during these searches.

Super-Kamiokande is the largest detector built to look for NDK and it has been taking data since 1996.
The Super-Kamiokande Detector

- Multipurpose 50 kton water Cherenkov detector (22.5 kton fiducial).
- Optically separated into:
  - Inner Detector: 11,146 20” PMTs
  - Outer Detector: 1,885 8” PMTs
- Excellent particle identification between showering (e-like) and non-showering (μ-like) rings.

Four Run Periods:
SK-I (96-01)  SK-II (03-05)
SK-III (05-08) SK-IV (08-present)

New front-end electronics
The modes: \( p \rightarrow e^+ \pi^0 \) and \( p \rightarrow \mu^+ \pi^0 \)

**Event Characteristics**
- The \( l^+ \) and \( \pi^0 \) are back-to-back (459 MeV/c).
- \( \pi^0 \rightarrow \gamma \gamma \): all final state particles are detectable.
- Able to reconstruct proton mass and momentum.
- Atmospheric neutrino interactions can mimic this type of signal.
Analysis Improvements

PRD 95, 12004 (2017)

Two Box Analysis

- **Region 1**: $P < 100$ MeV/c.
  - Dominated by free protons.
  - No nuclear effects $\rightarrow$ Less Systematics.
- **Region 2**: $100 < P < 250$ MeV/c.
  - Dominated by bound protons.

Neutron Capture (SK-IV only)

- Atm-$\nu$ interactions can produce neutrons in the final state.
- Neutron is captured by Hydrogen and a photon is emitted.
- Half of the remaining atm background can be removed using neutron tagging.

(2012) 220 kton $\cdot$ yrs data from SK I-II $\rightarrow$ (2017) 306 kton $\cdot$ yrs data from SK I-IV.

Lifetime Limit at 90% CL with 306 kton \cdot yrs exposure

- $p\rightarrow e^+\pi^0$: $1.6 \cdot 10^{34}$ years
- $p\rightarrow \mu^+\pi^0$: $7.7 \cdot 10^{33}$ years
Other N → \(l^+ + \text{meson} \) Searches

\[\begin{align*}
\text{p} & \to (e^+, \mu^+) + (\eta, \rho^0, \omega) \\
\text{n} & \to (e^+, \mu^+) + (\pi^-, \rho^-)
\end{align*}\]

- Systematic search for several modes of anti-lepton + meson.
- Exposure has increased to 316 kton \(\cdot\) year, 2.26 times more data since last result (2012).
- Similarly to \(l^+\pi^0\), the analysis benefit from neutron tagging in SK-IV.
- 2-Box separation is introduced for \(p \to l^+\eta\), with \(\eta \to \gamma\gamma\) only.
N → ℓ⁺ + meson Results

- Most channels have increased by a factor of 2 or 3 since the previous publication (SK-I and II).

- Some events have been observed, but in all cases the observation was consistent with expected background.

PRD 96, 012003 (2017)
**p → \bar{\nu} K^+: Prompt-\gamma and Monochromatic Excess Searches**

**Event Characteristics**

- Neutrino and Kaon are invisible.
- Dominant Kaon decay mode: mono-chromatic \( \mu \) with \( \sim 236 \) MeV/c.
- Nuclear de-excitation: \( \sim 6 \) MeV \( \gamma \).
- Coincidence measurement of low-E \( \gamma \) and a mono-energetic \( \mu \).
- If \( \gamma \) not found: look for excess of monochromatic \( \mu \) in the spectra (statistically independent search).

---

**Event Characteristics**

- Neutrino and Kaon are invisible.
- Dominant Kaon decay mode: mono-chromatic \( \mu \) with \( \sim 236 \) MeV/c.
- Nuclear de-excitation: \( \sim 6 \) MeV \( \gamma \).
- Coincidence measurement of low-E \( \gamma \) and a mono-energetic \( \mu \).
- If \( \gamma \) not found: look for excess of monochromatic \( \mu \) in the spectra (statistically independent search).

$p \rightarrow \bar{\nu} K^+$ Hadronic Decay

**Kaon Hadronic Decay**

- Kaon decays to $\pi^+\pi^0$.
- Mono-chromatic $\pi^0$ (205 MeV/c) and faint $\pi^+$.
- $E_{bk}$: energy in the **backward** region defined by the $\pi^0$ direction.
- $E_{res}$: residual hits close to the $\pi^+$ direction.

**Event Selection**

- 1 or 2 rings consistent with 205 MeV/c $\pi^0$.
- $E_{bk}$ consistent with faint $\pi^+$.
- Low residual activity in the detector ($E_{res}$).
p → $\bar{\nu}$ K$^+$ Results

PRD 90, 072005 (2014)

2017 Updates

- 260 $\rightarrow$ 349 kton $\cdot$ yrs exposure.
- Neutron tagging in SK-IV.
- No candidate events were observed in either search methods.

Lifetime Limit at 90% CL with 349 kton $\cdot$ yrs exposure

Update

$8.0 \cdot 10^{33}$ years
Reconstruction with fiTQun

• FiTQun is a new maximum likelihood event reconstruction algorithm in SK. Based on MiniBooNE (NIM A608, 206 - 2009) Official T2K result (PRL 112, 061802 - 2014)

• For a given set $X$, charge and time PDF’s are produced for each PMT in SK.
• A likelihood is calculated for the event hypothesis.
• Event hypothesis are chosen by comparing best-fit likelihoods.

- A single track can be specified by a particle type (PID) plus 7 kinematic variables ($X$):
  - Position ($x, y, z, t$)
  - Momentum ($p$)
  - Direction ($\theta, \phi$)

Based on MiniBooNE (NIM A608, 206 - 2009)
T2K Official T2K result (PRL 112, 061802 - 2014) Isotropic Muons $0 < p < 1\text{ GeV}$
\[ \nu \rightarrow \bar{\nu} K^+ : \text{Prompt-}\gamma \text{ Search with fiTQun} \]

- Event hypothesis: simultaneously fit for \( \mu \)-like ring + 6 MeV \( \gamma \).
- FiTQun can reconstruct the \( \gamma \) energy and time.
- Lower \( \Delta t \) reconstruction is achieved by comparing with CCQE hypothesis.

**Preliminary Results**

- Similar performance for high \( \Delta t \) values.
- Significant improvement for low \( \Delta t \).
- **Efficiency gain**: 9.4\% \( \rightarrow \) 13.9\%.
- Similar expected background.
Summary and Prospects

- Super-Kamiokande can search for many different NDK modes.
- Most modes have been updated to more than 300 kton · yrs exposure.
- Observed candidates are consistent with expected background.
- New search methods are being developed.
- Preliminary results indicate significant improvements on efficiency (~50%).

The modes: \( p \rightarrow e^+ \pi^0 \) and \( p \rightarrow \mu^+ \pi^0 \)

Event Characteristics
- The \( l^+ \) and \( \pi^0 \) are back-to-back (459 MeV/c).
- \( \pi^0 \rightarrow \gamma \gamma \): all final state particles are detectable.
- Able to reconstruct proton mass and momentum.
- Atmospheric neutrino interactions can mimic this type of signal.

Event Selection
- All rings are fully contained inside the tank and inside the fiducial volume (2 m away from inner wall) - FCFV.
- 2 or 3-ring event.
- \( e^+ \pi^0 \): all rings are e-like and without a decay-e.
- \( \mu^+ \pi^0 \): 1 \( \mu \)-like ring + 1 or 2 e-like rings with 1 decay-e.
- \( 85 < M_{\pi^0} < 185 \) MeV/c\(^2\) (only for 3-ring case).
- \( 800 < M_{\text{Tot}} < 1050 \) MeV/c\(^2\) and \( P_{\text{Tot}} < 250 \) MeV/c.
Neutron Capture

- Most of the atm-ν interactions produce neutrons in the final state.
- A neutron can be captured by a Hydrogen atom (~200 μs) and emit a 2.2 MeV photon: $n + p \rightarrow d + \gamma$.
- SK-IV new electronics allow to search for hits coming from this photon using a neural network.
- Half of the remaining background can be removed using neutron tagging.

Two Box Analysis

• Signal Box defined by $800 < M_{\text{Tot}} < 1050 \text{ MeV/c}$ and $P_{\text{Tot}} < 250 \text{ MeV/c}$ is divided into 2 regions to improve sensitivity:
  
  1. Lower box: $P_{\text{Tot}} < 100 \text{ MeV/c}$
     
     — The region is dominated by free proton (H) decays and almost background free.
     
     — Less systematics due to no nuclear effects.
  
  2. Higher box: $100 < P_{\text{Tot}} < 250 \text{ MeV/c}$
     
     — Dominated by bound protons (0) and background events are more likely.
     
     — Systematic uncertainty is higher due to nuclear effects.

![Graph showing free and bound protons](image)

![Graph showing atmospheric neutrinos](image)
N → l^+ + meson

**Number of Rings**
- lepton*: 1 e-like ring with no decay-e for l = e and 1 \( \mu^-\)-like ring with 1 decay-e for l=\( \mu^-\).
- \( \eta \rightarrow \gamma \gamma \): 2 e-like rings.
- \( \eta \rightarrow 3\pi^0 \): 3 or 4 e-like rings.
- \( \rho \rightarrow \pi^+\pi^- \): 2 \( \mu^-\)-like rings.
- \( \omega \rightarrow \pi^0\gamma \): 2 or 3 e-like rings.
- \( \omega \rightarrow \pi^+\pi^-\pi^0 \): 1 \( \mu^-\)-like rings and 2 e-like ring.
- \( \pi^- \): 1 \( \mu^-\)-like ring.
- \( \rho^- \rightarrow \pi^-\pi^0 \): 1 \( \mu^-\)-like rings and 2 e-like ring.

*except for \( p \rightarrow \mu^+\omega \) and \( n \rightarrow \mu^+\rho^- \).

**Reconstructed Meson Mass**
- \( \eta \): (480, 620) MeV/c^2.
- \( \rho \): (600, 900) MeV/c^2.
- \( \omega \): (650, 900) MeV/c^2.

**Reconstructed Nucleon Mass**
- Total Mass: (800, 1050) MeV/c^2.
- (600,800) MeV/c^2 for \( e^+\omega \).
- (450,700) MeV/c^2 for \( \mu^+\omega \).

**Reconstructed Nucleon Momentum**
- Total momentum < 250 MeV/c.
- < 150 for \( \eta \rightarrow 3\pi^0 \).
- < 200 for \( \omega \rightarrow \pi^+\pi^0 \).
\[ p \rightarrow \bar{\nu} K^+ : \text{Prompt-}\gamma \text{ Search} \]

**Event Characteristics**
- Neutrino and Kaon are invisible.
- Dominant Kaon decay mode: \( \mu \) is mono-chromatic \( \sim 236 \text{ MeV/c} \).
- Nuclear De-excitation: \( \sim 6 \text{ MeV gamma} \).
- Coincidence measurement of low-E \( \gamma \) and a mono-energetic \( \mu \).

**Event Selection**
- 1-ring \( \mu \)-like with a decay-e.
- \( 215 < P_\mu < 260 \text{ MeV/c} \).
- Search for hit cluster with a sliding window of 12 ns:
  - \( 8 < N_\gamma < 60 \) hits (SK-I, III, IV)
  - \( 4 < N_\gamma < 30 \) hits (SK-II)
- Time Difference < 75 ns.
- No neutrons in SK-IV.
$p \rightarrow \bar{\nu} K^+$: Prompt-$\gamma$ Search with fiTQun

Reconstructed $\gamma$ Energy

PDK Signal
Atm-$\nu$ Background

Preliminary
Muons with fiTQun

- Tested on a uniform distribution of muons between 0 and 1 GeV/c
- Isotropic & random position (inside FV & charge>200pe)
- Significant improvements in the vertex and momentum resolution
Electrons with fitQun

- Tested on a uniform distribution of $e^-$ between 0 and 1 GeV/c
- Isotropic & random position (inside FV & charge $>200$pe)
- Significant improvements in the vertex and momentum resolution
Single Track PID with fitTQun

- Simple line cut can be used to separate muons and electrons
- Significantly improved particle ID
