

Neutrino Vertex Reconstruction/Selection

Yujing Sun, Tingjun Yang

Mar 20th, 2017, Honolulu, Hawaii

Introduction

UNIVERSITY
of HAWAII®
MĀNOA

- Compare two reconstruction algorithms: Pandora and PMTrack.
- 0 to multiple reco vtx stored for each ν_μ event. Define an algorithm to select the best reco vtx.
 - First check the position resolution for the closest vtx.
 - Compare the position resolution to the closest vtx.
- Using 30K MC simulation neutrino data are from:
`/pnfs/dune/scratch/dunepro/v06_18_00/reco/prodgenie_nu_dune10kt_1x2x6`

Event Selection and Categorization

UNIVERSITY
of HAWAII®
MĀNOA

- FV defined as:
 - $|x| \leq 310 \text{ cm}$, $|y| \leq 550 \text{ cm}$, $z \leq 1244$ && $z \geq 50 \text{ cm}$
- Events are categorized in to ν_{μ} CC, NC and ν_e CC.

Summary

UNIVERSITY
of HAWAII®
MĀNOA

- Using the most upstream reconstructed vtx, the fitted ΔX , ΔY , ΔZ and ΔR has a 1cm resolution, similar as using the closest vtx.
- Using the most upstream vtx, Pandora is better than PMTrack probably due to the short backtrack photons reconstructed by PMTrack.
- Fitted histograms for NC and ν_e CC are shown in Backup Slides.
