

The MINERvA Operations Report

Nuruzzaman

(home.fnal.gov/~nur/)

for the MINERvA Collaboration

All Experimenters Meeting

15 May 2017

Live Time and Data

May 4 - May 10, 2017: POT Delivered = 1.57×10^{19}

Miscellaneous Updates

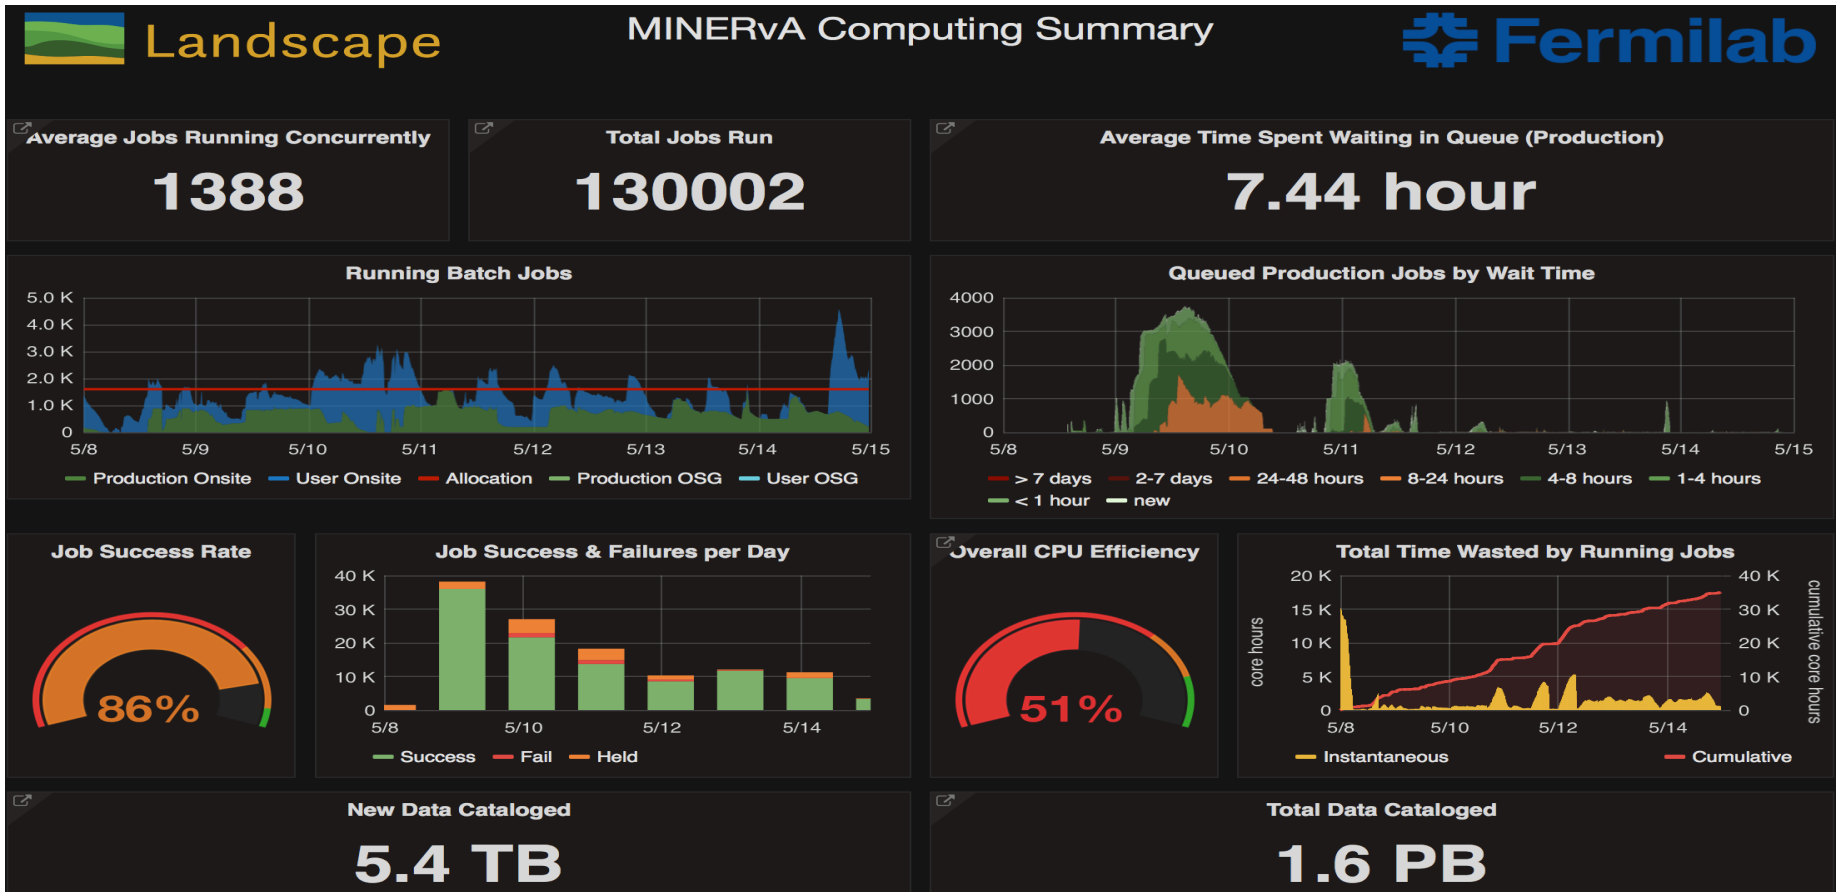

- ❑ 05/04 Thu – MINERvA DAQ stopped with a communication error between Front End Boards and it's Controller on few chains. We recovered after few software resets, but lost few hours of beam.
 - few MINERvA files failed to process
 - noisy ADC channel, replaced MINOS minder

- ❑ 05/05 Fri – Another noisy channel on MINOS. Recalibrated the crate and the detector. The channel is back to normal.

- Turned off MINERvA and MINOS detectors before the power outage this morning. Will turn them back on after the last outage this evening.

Computing

- Average concurrent jobs are lower than quota
- Job Success rate is slightly low, users' job connecting MINOS DB got slower and caught by time limit (8h)
- Overall CPU Efficiency is low due to MINOS DB access issue. Experts are working on re-optimizing connection parameters with DB admins from SCD.

Period 05/08 - 05/14, 2017

Thank You
