

Applying Deep Learning Algorithms to Alarm/Anomaly Detection for Grid Jobs

Tuesday, August 15, 2017 10:50 AM (20 minutes)

Supervisor: Michael Kirby

With a complex system of distributed computing, failures within the OSG infrastructure can be difficult to recognize and distinguish because of the rapidly changing dynamics of job scheduling and misbehaving infrastructure. The project dealt with utilizing Deep Learning algorithms from tensorflow and the monitoring data of the Fermilab GPGGrid to develop an anomaly detection program to identify abnormal behaviors within the system.

Presenter: Mr TORRES, Erik (SIST)
