

CMS-SUS-16-050

Search for supersymmetry with a top tagger

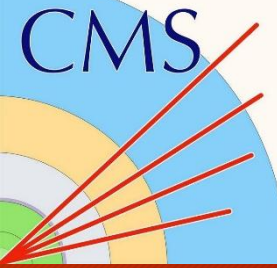

Hui Wang

University of Illinois at Chicago

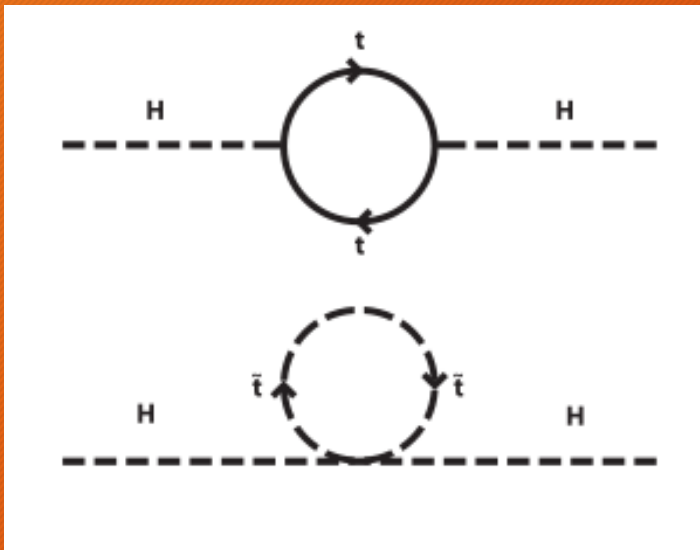

USLUA meeting

November 3, 2017

Introduction

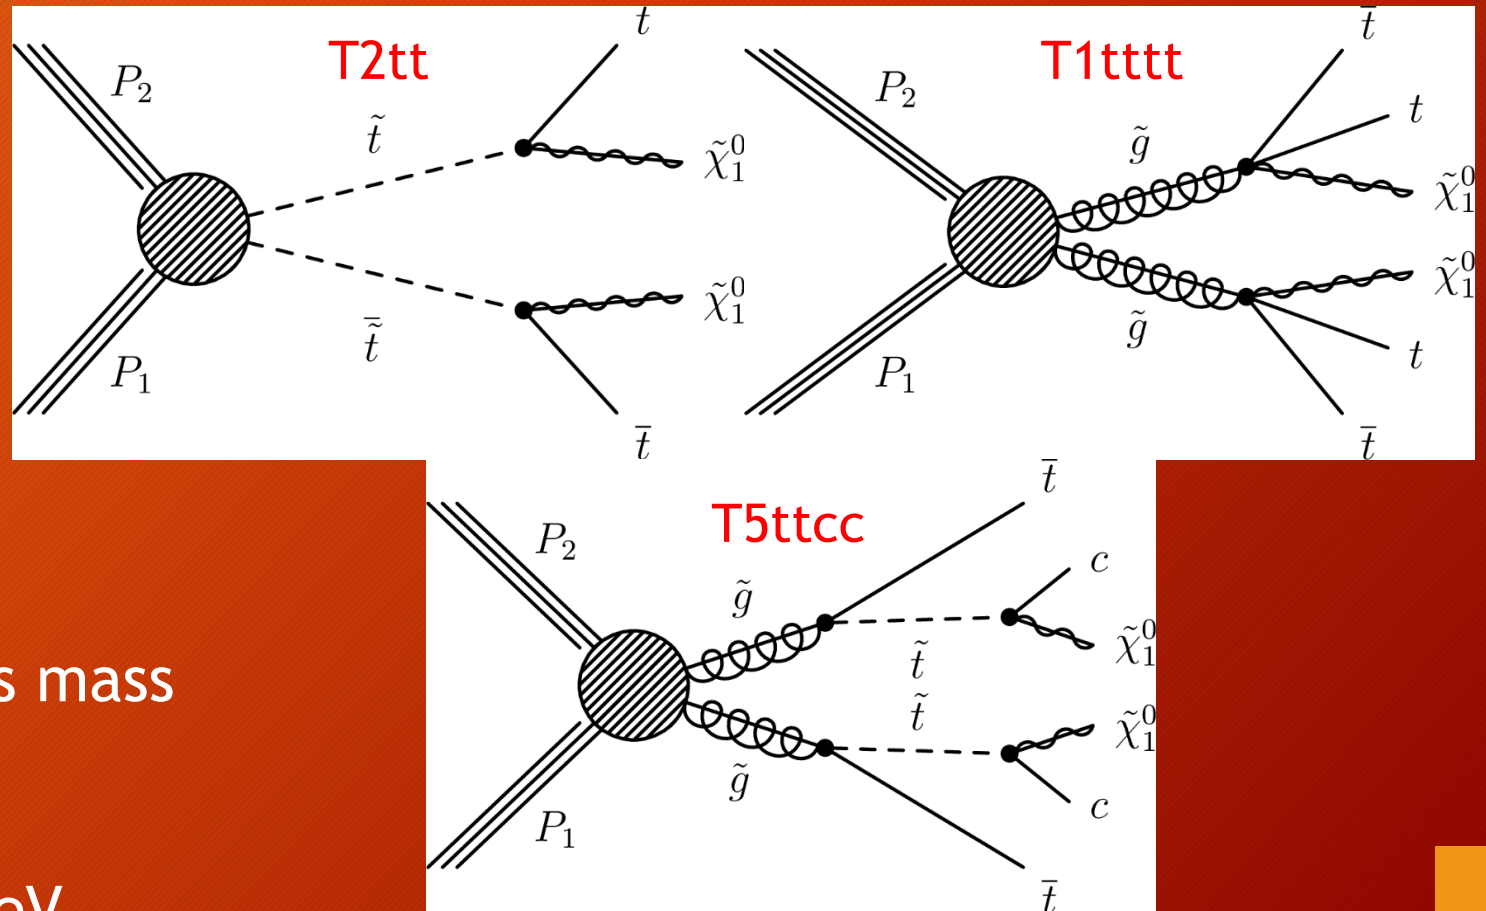

Why sTop?

- Top contributes most to the quantum correction of Higgs mass
- SUSY broken
- Natural models of SUSY:
sTop mass less than a few TeV

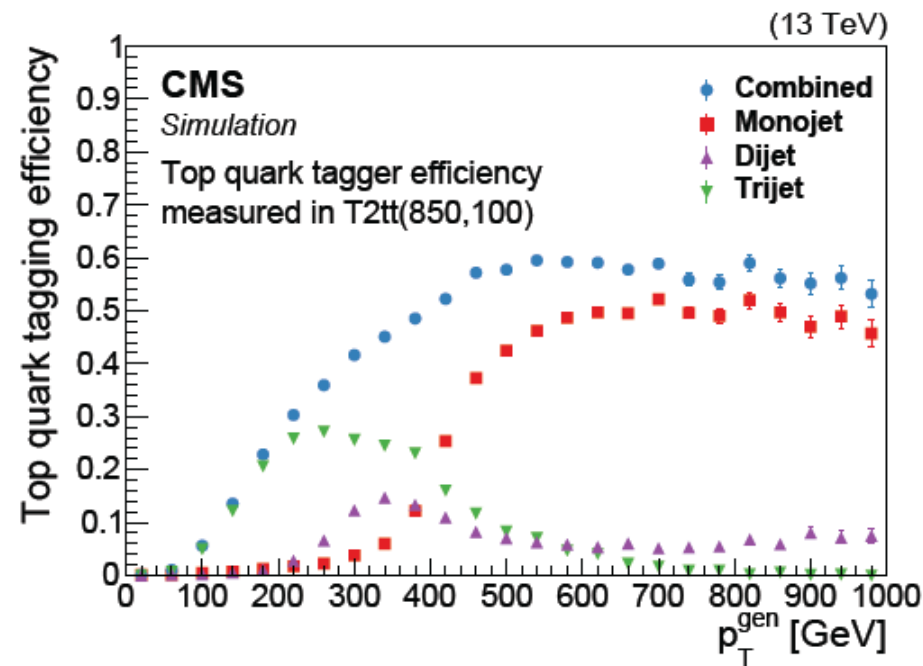

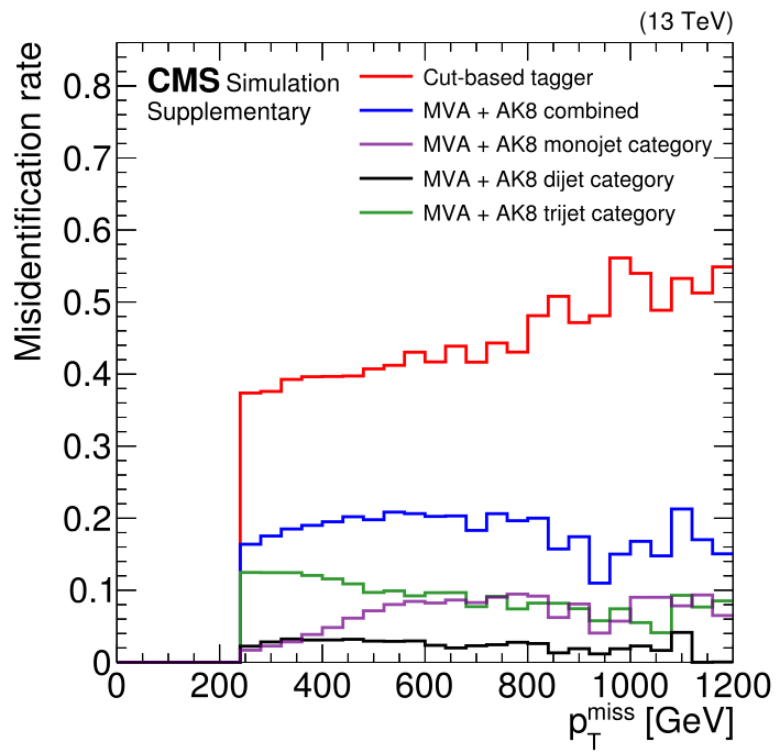

Simplified SUSY models

Top tagger

CMS

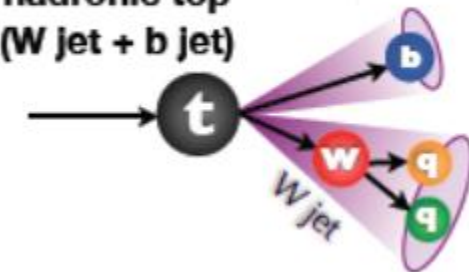

Many thanks to Ken Call for his nice introduction of our powerful top tagger!

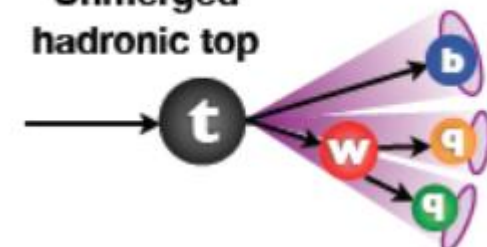

Fully merged
hadronic top jet

Partially merged
hadronic top
(W jet + b jet)

Unmerged
hadronic top

Baseline and Search Bin

● Jets and pT_{miss} :

- $N_{jets} (pT > 50) \geq 2$
- $N_{jets} (pT > 30) \geq 4$
- $pT_{miss} > 250 \text{ GeV}$
- $HT > 300 \text{ GeV}$
- $\Delta\phi (j1,2,3, pT_{miss}) > 0.5, 0.3, 0.3$
- $N_b \geq 1$

● Lepton veto :

- $N_e, N_\mu \text{ and } N_\tau = 0$

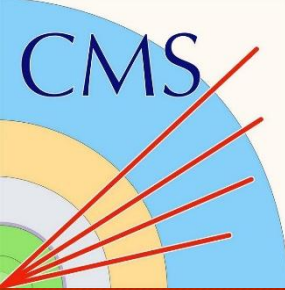

● Top reconstruction:

- $N_t \geq 1$ with top tagger
- $MT2 > 200 \text{ GeV}$

Binning variables

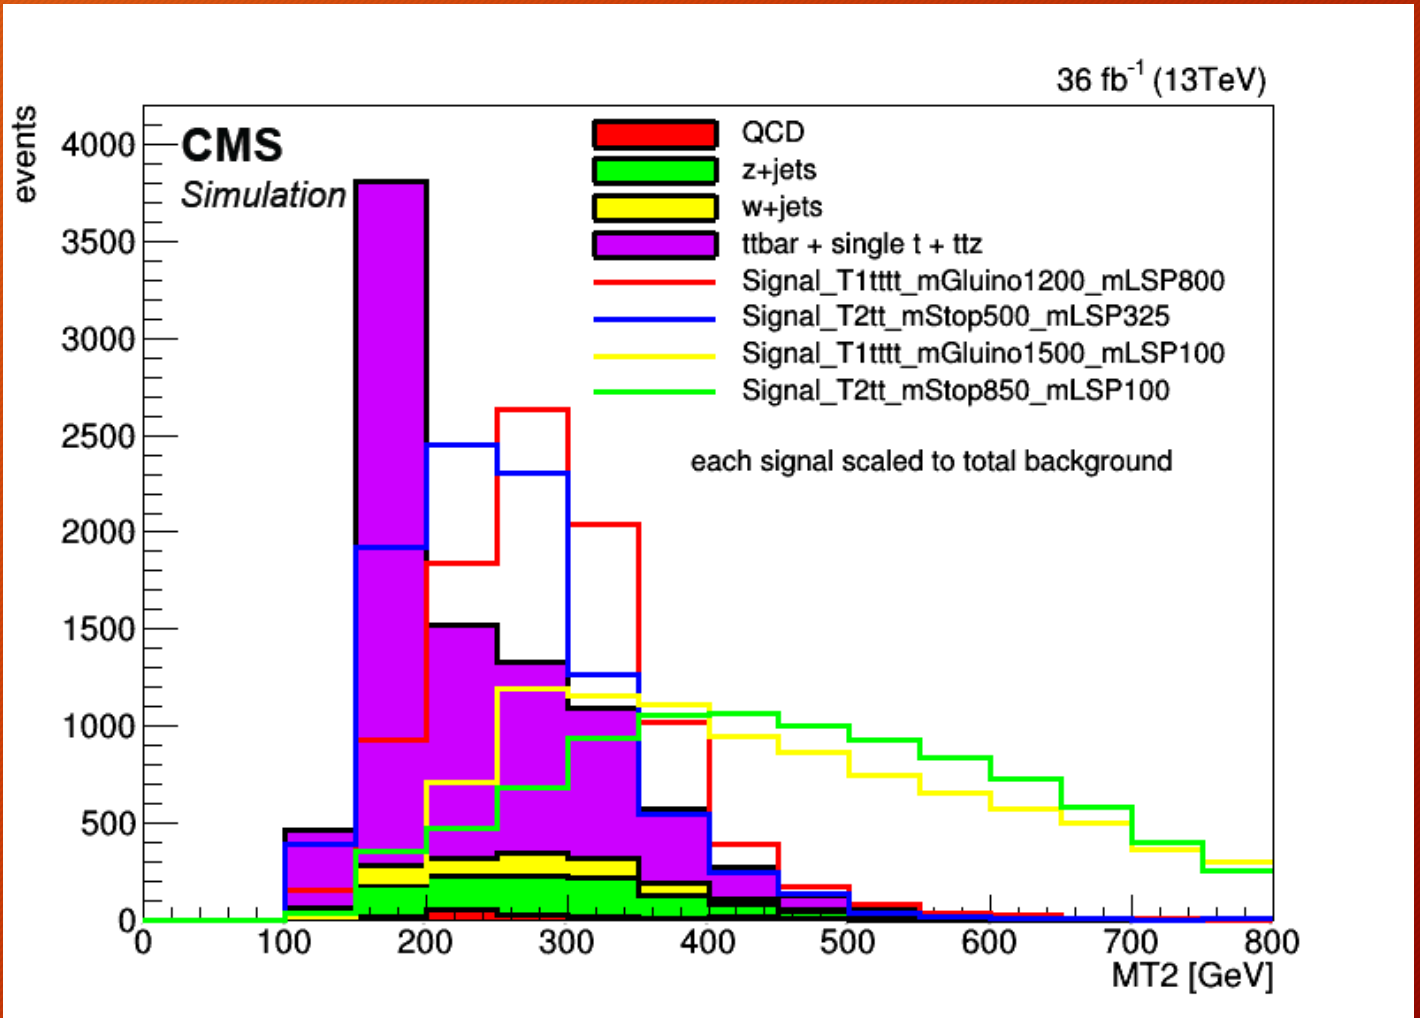

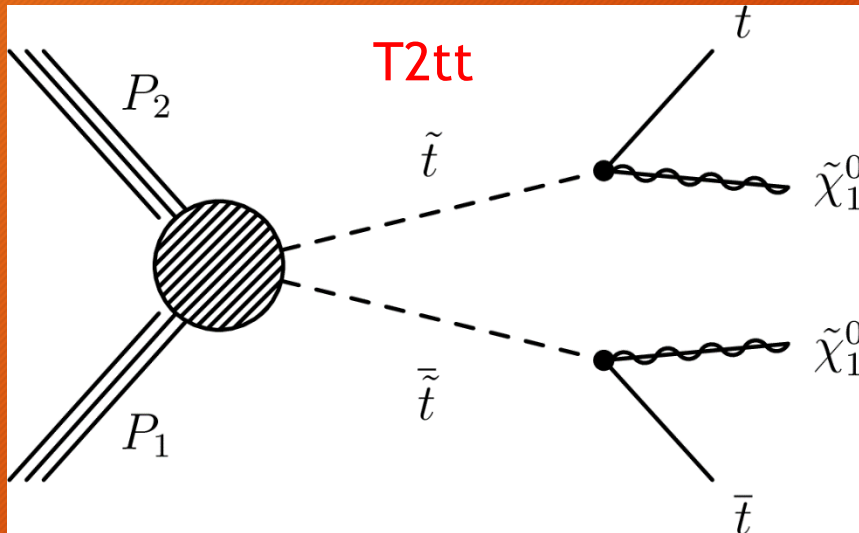

$N_t \backslash N_b$	1	2	≥ 3
1	p_T^{miss}, M_{T2}	p_T^{miss}, M_{T2}	p_T^{miss}, H_T
2	p_T^{miss}, M_{T2}	p_T^{miss}, M_{T2}	p_T^{miss}, H_T
≥ 3	p_T^{miss}, H_T	p_T^{miss}, H_T	p_T^{miss}, H_T

MT2

MT2: an extension of MT
(transverse mass)

A special algorithm to
separate pT_{miss} into two
parts, associated with two
Tops

Background estimation

• Dominant Backgrounds

- $t\bar{t}$ /single top/ W +jets (~75%)

Estimated by data driven approach using translation factors

- $Z(\nu\nu)$ +jets (~17%)

Estimated by data corrected MC

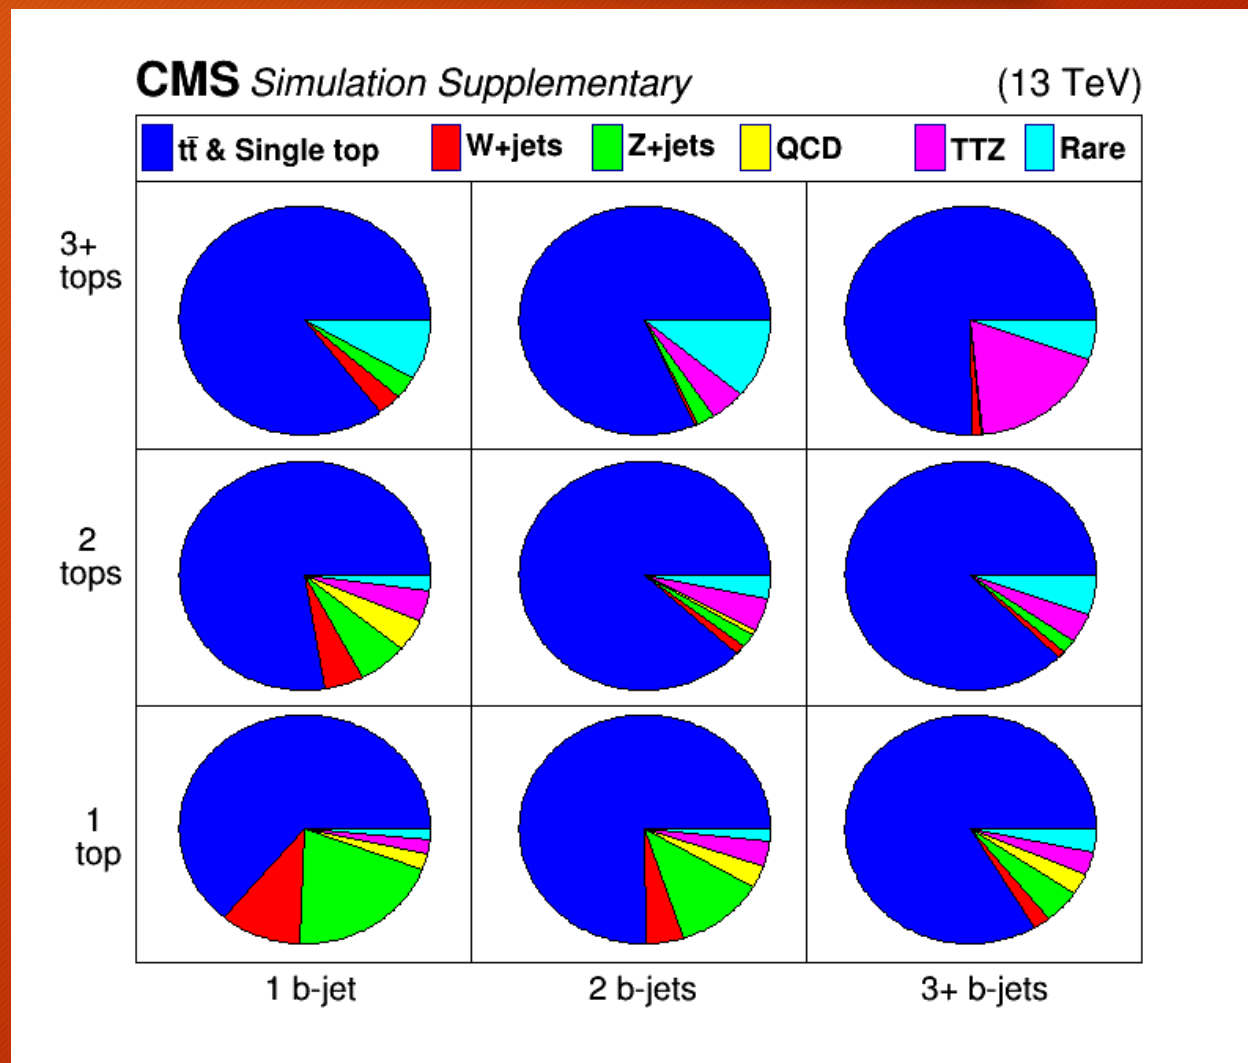

- QCD (~3%)

Estimated in data sideband with data-normalized translation factors derived from MC

• Sub-dominant backgrounds

- $t\bar{t}Z$ (~2%)
- Rare (~3%)

Estimated from MC

Translation Factor method

Lost lepton (LL) events in $t\bar{t}$ /single top/ W +jets

Control region (CR)

Baseline cut without
lepton veto

Signal region (SR)

Baseline cut

MC

$N_{cr} (MC) =$
number of events
in MC CR

$N_{sr} =$ number of
events with gen
level LL in MC SR

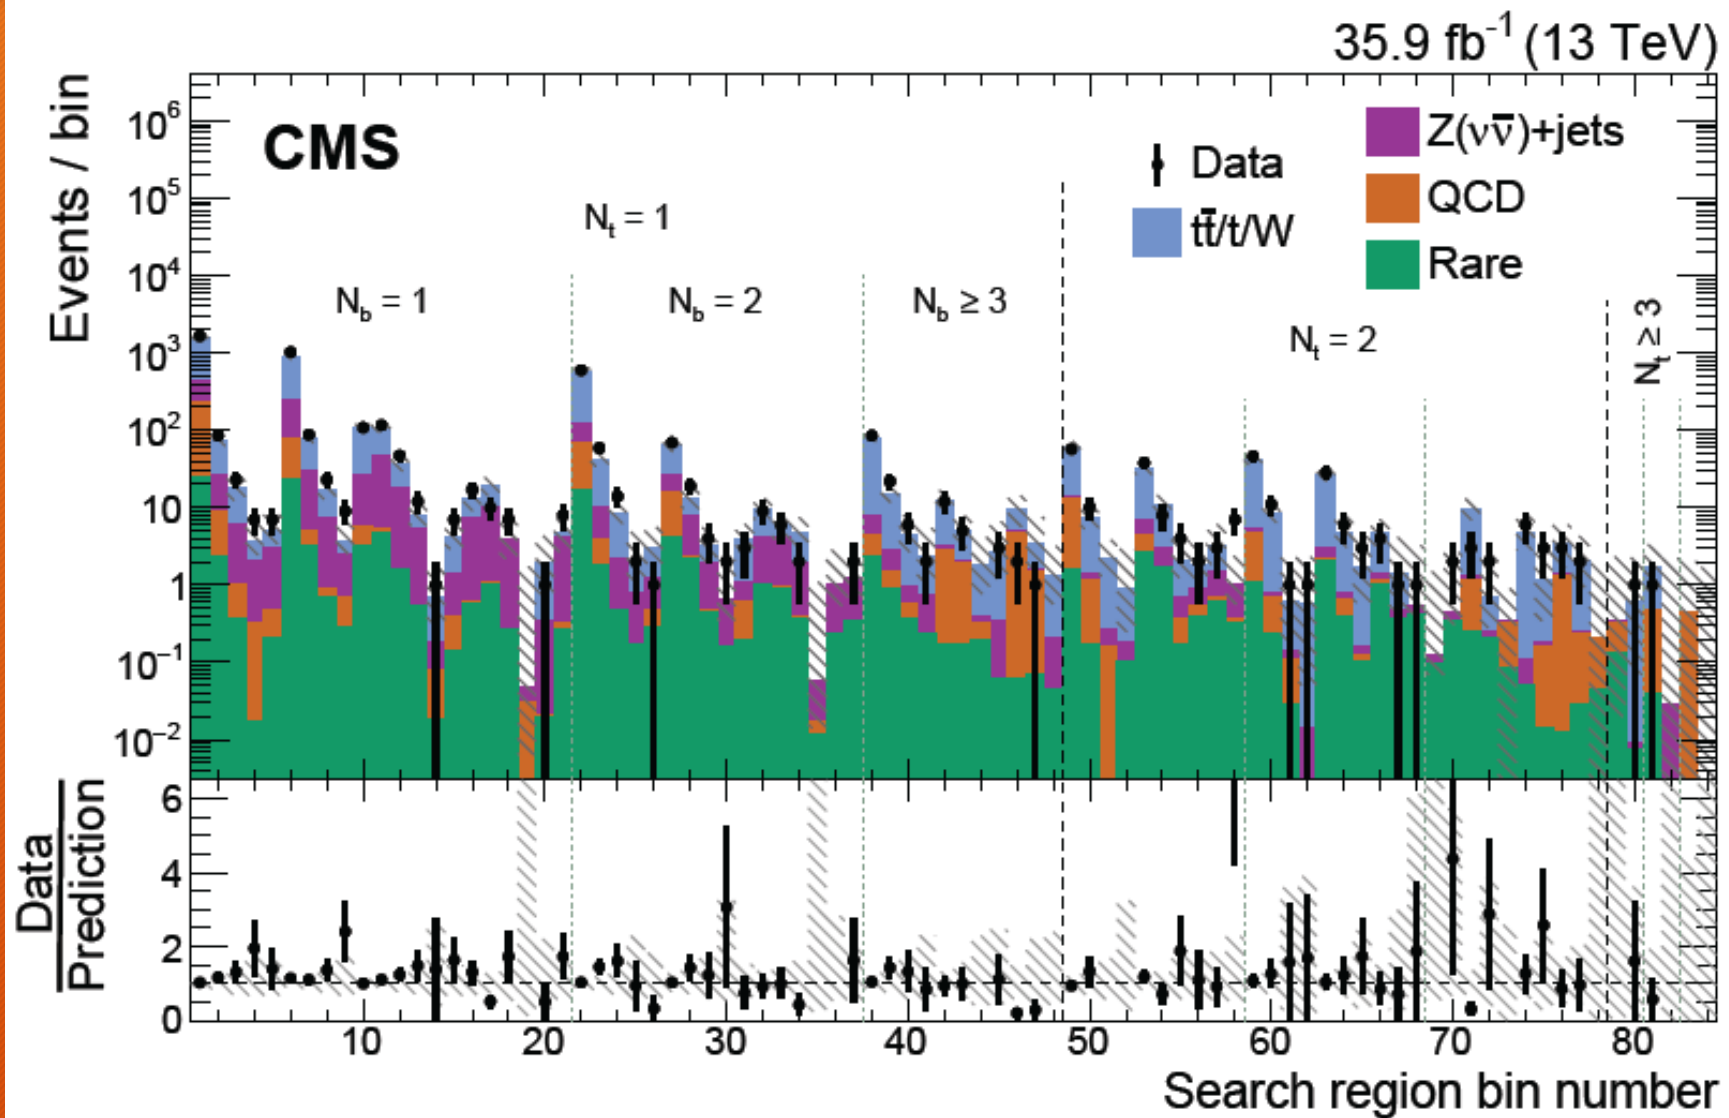

data

$N_{cr} (data) =$
number of events
in data CR

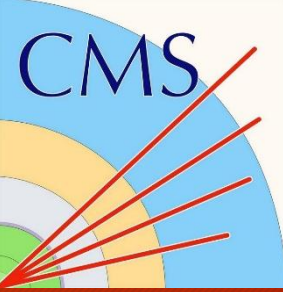

LL background
prediction =
 $N_{cr}(data) * TF$

$$TF = \frac{N_{sr}}{N_{cr}}$$

Results

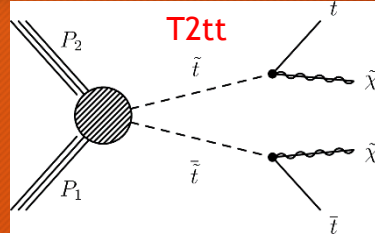

Limits - T2tt

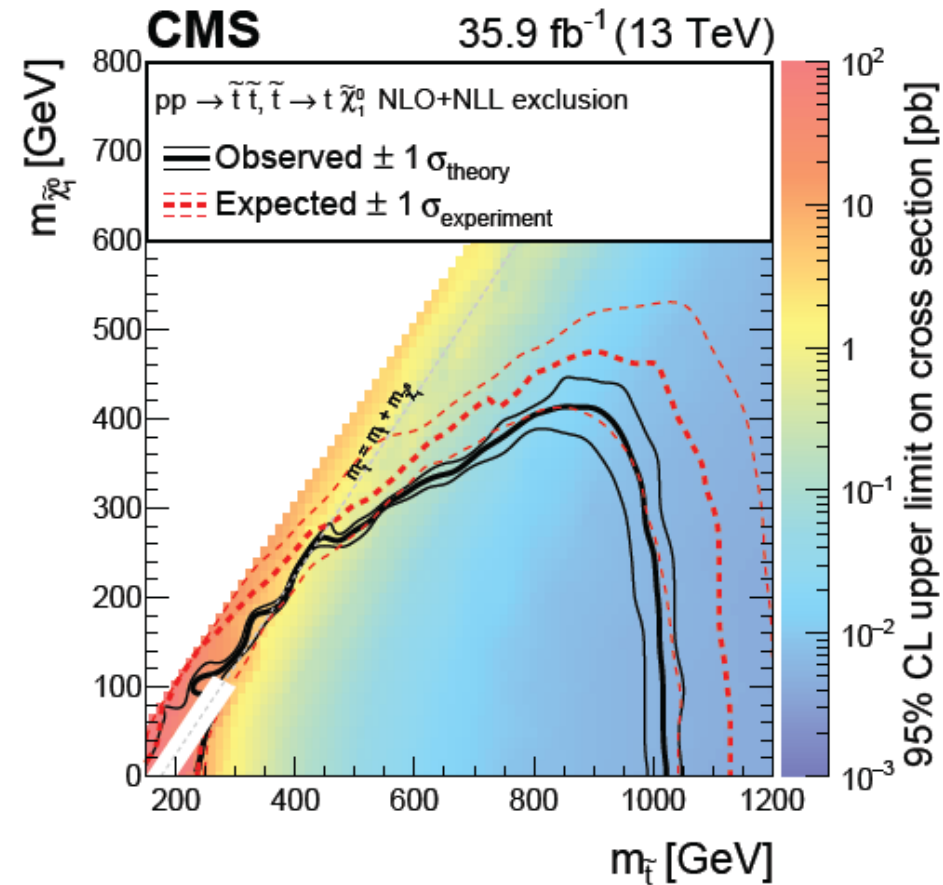

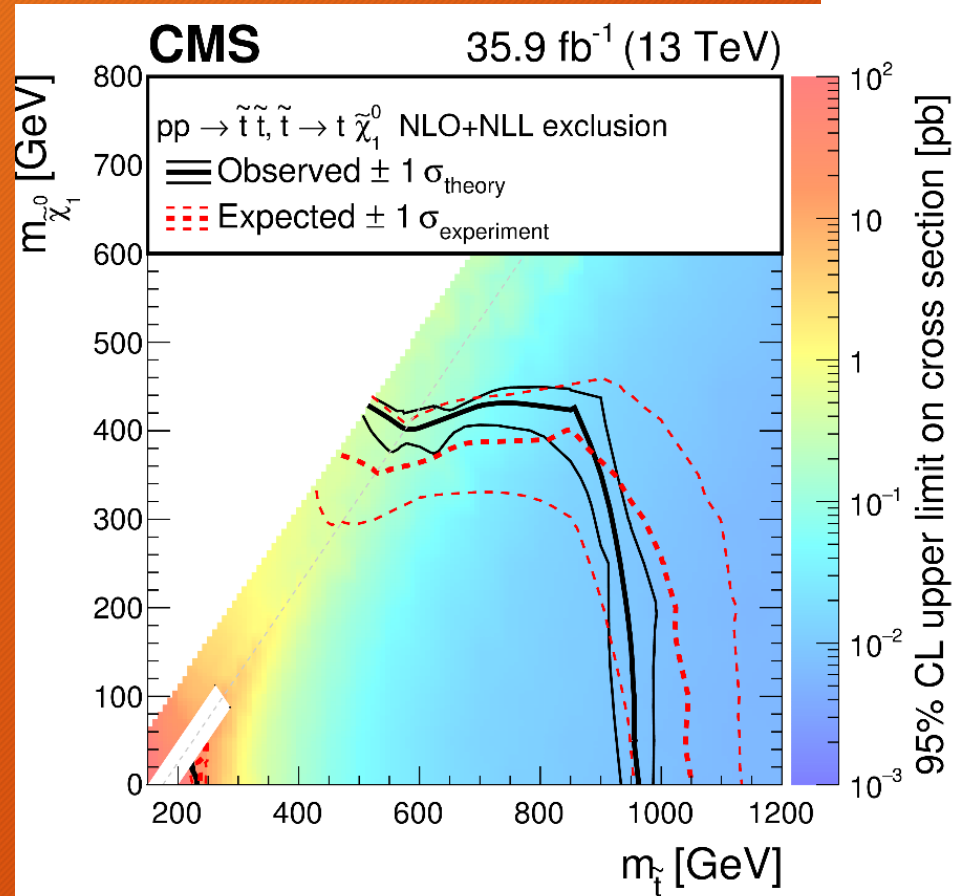

Limits without top tagger

<http://cms-results.web.cern.ch/cms-results/public-results/publications/SUS-16-033/index.html>

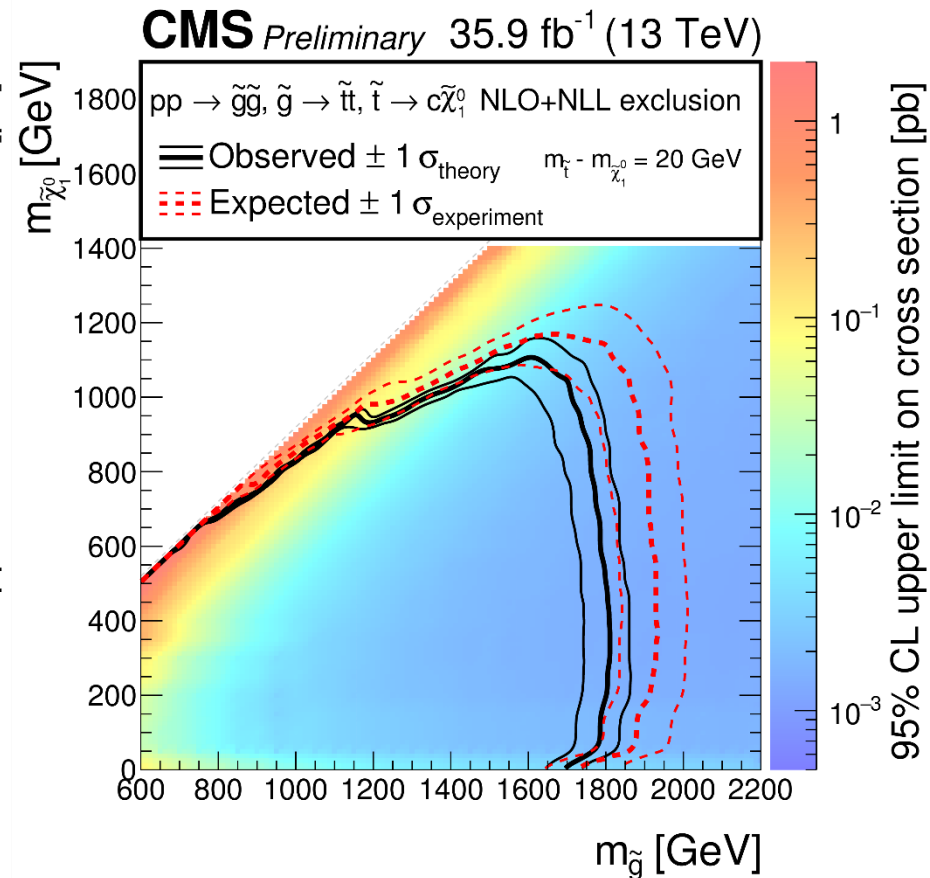

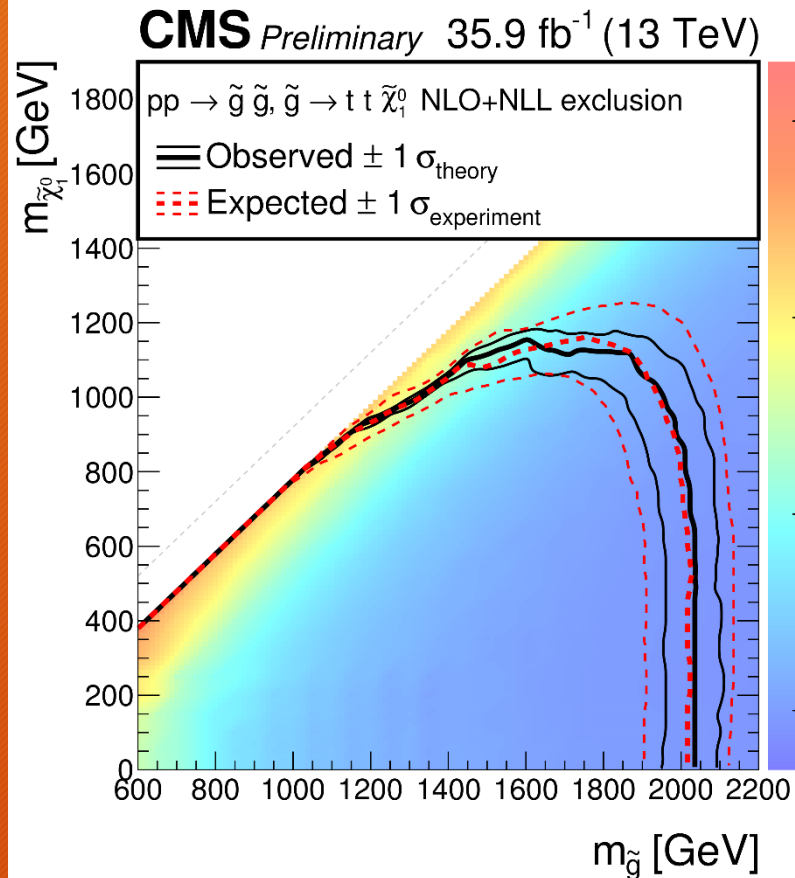

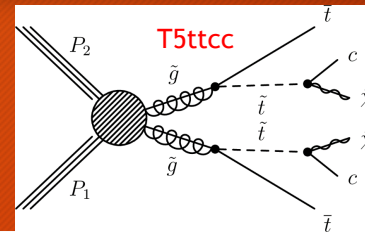

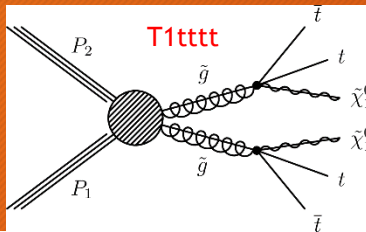

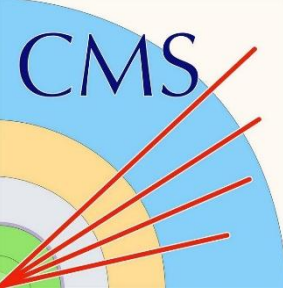

Limits with top tagger

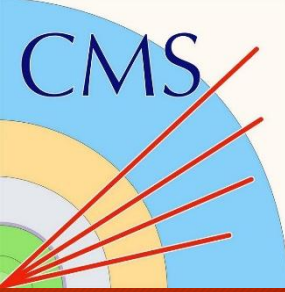

<http://cms-results.web.cern.ch/cms-results/public-results/preliminary-results/SUS-16-050/index.html>

Limits - T1tttt and T5ttcc

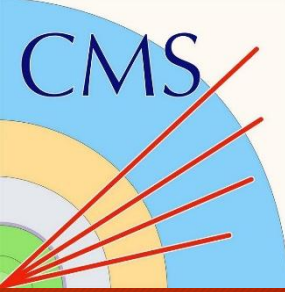

Conclusion and Outlook

- A powerful top tagger is designed and applied in our analysis
- We have elaborately worked out the background
- No statistically significant excess of Standard Model is observed
- The previous limits of the masses of SUSY particles are extended
- Future of our analysis:
 - Even more powerful top tagger with neural network
 - Search region expansion, especially at compressed region

Thank you for your attention!

Baseline detail

● Top reconstruction:

- $N_t \geq 1$ with top tagger
- $MT2 > 200 \text{ GeV}$

● Jets and pT_{miss} :

- AK4PF jets with CHS:
 $N_{jets}(pT > 50) \geq 2$
 $N_{jets}(pT > 30) \geq 4$
- $pT_{miss} > 250 \text{ GeV}$
- $HT > 300 \text{ GeV}$
- $\Delta\phi(j1, 2, 3, pT_{miss}) > 0.5, 0.3, 0.3$
- $N_b \geq 1$ (CSVM)

● Lepton/track veto:

- μ veto: $pT > 10 \text{ GeV}$, medium ID &&

miniISO

- e veto: $pT > 10 \text{ GeV}$, veto ID && miniISO
- IsoTrack: e/μ track ($rellso < 0.2$ && $pT > 5 \text{ GeV}$) or π track ($rellso < 0.1$ && $pT > 10 \text{ GeV}$), $M_{tW} < 100 \text{ GeV}$

● Noise cleaning:

- HBHENoiseFilter, HBHENoiseIsoFilter, EcalDeadCellTriggerPrimitiveFilter, GoodVertices, eeBadScFilter, CSC Tight Halo 2016 Filter, badPFMuonFilter, badChargedHadronFilter, LooseJetID+ PFMET/CaloMET < 5

MT2 detail

- Also known as The Stransverse Mass
- Author website:
- <http://www.hep.phy.cam.ac.uk/~lester/mt2/>

$$\tilde{l} \rightarrow l\tilde{\chi} \quad (6)$$

for arbitrary momenta we can write,

$$m_{\tilde{l}}^2 = m_l^2 + m_{\tilde{\chi}}^2 + 2(E_{Tl}E_{T\tilde{\chi}} \cosh(\Delta\eta) - \mathbf{p}_{Tl} \cdot \mathbf{p}_{T\tilde{\chi}}) \quad (7)$$

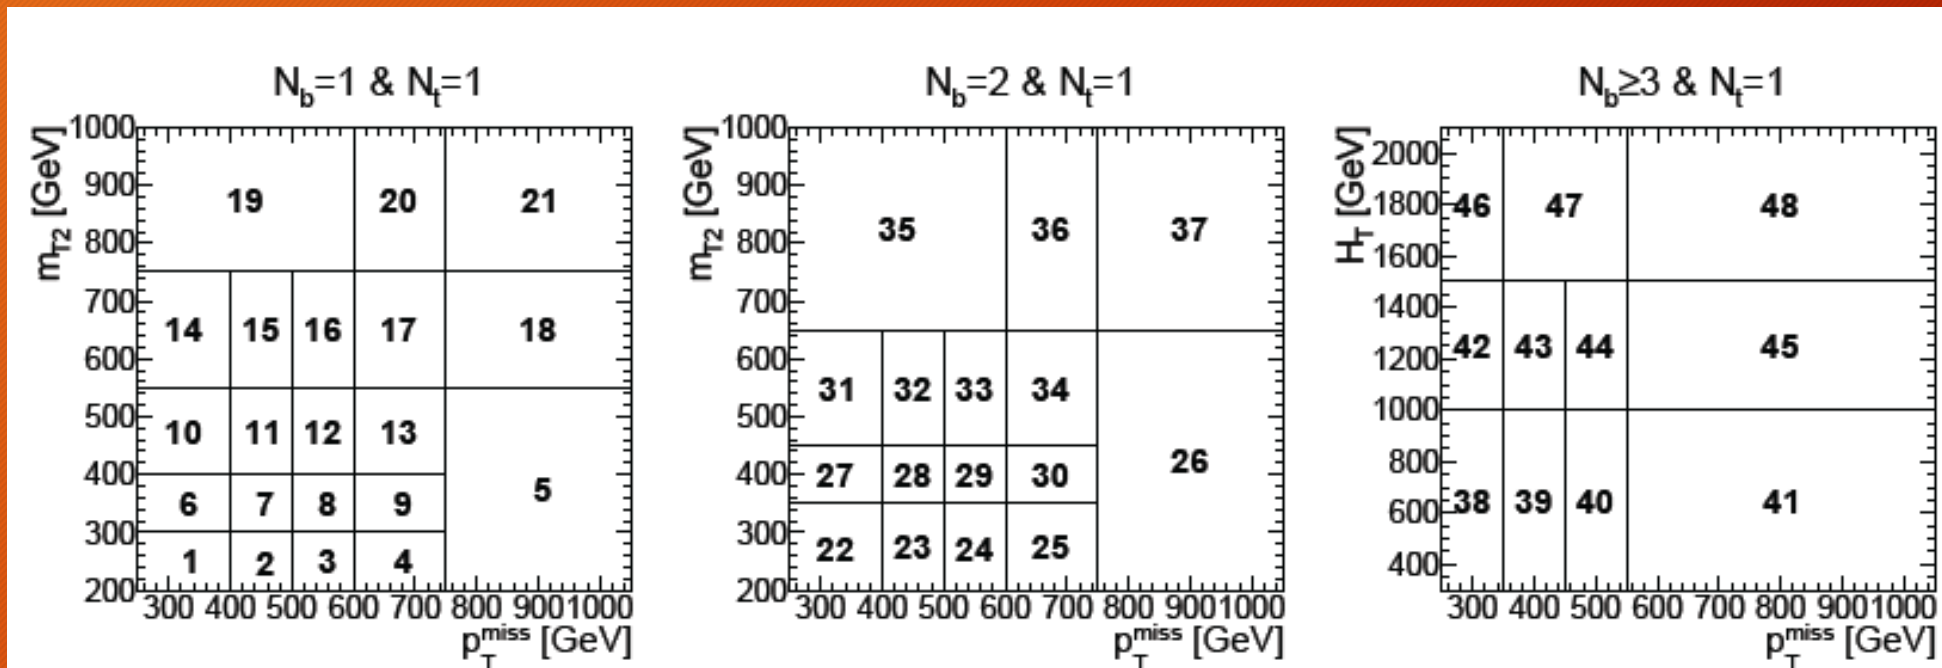

where $E_T = \sqrt{\mathbf{p}_T^2 + m^2}$ and $\Delta\eta$ is the difference in rapidity, $\eta = \frac{1}{2} \ln[(E + p_z)/(E - p_z)]$, between between the l and $\tilde{\chi}$.

Now as $\cosh \eta \geq 1$ we have,

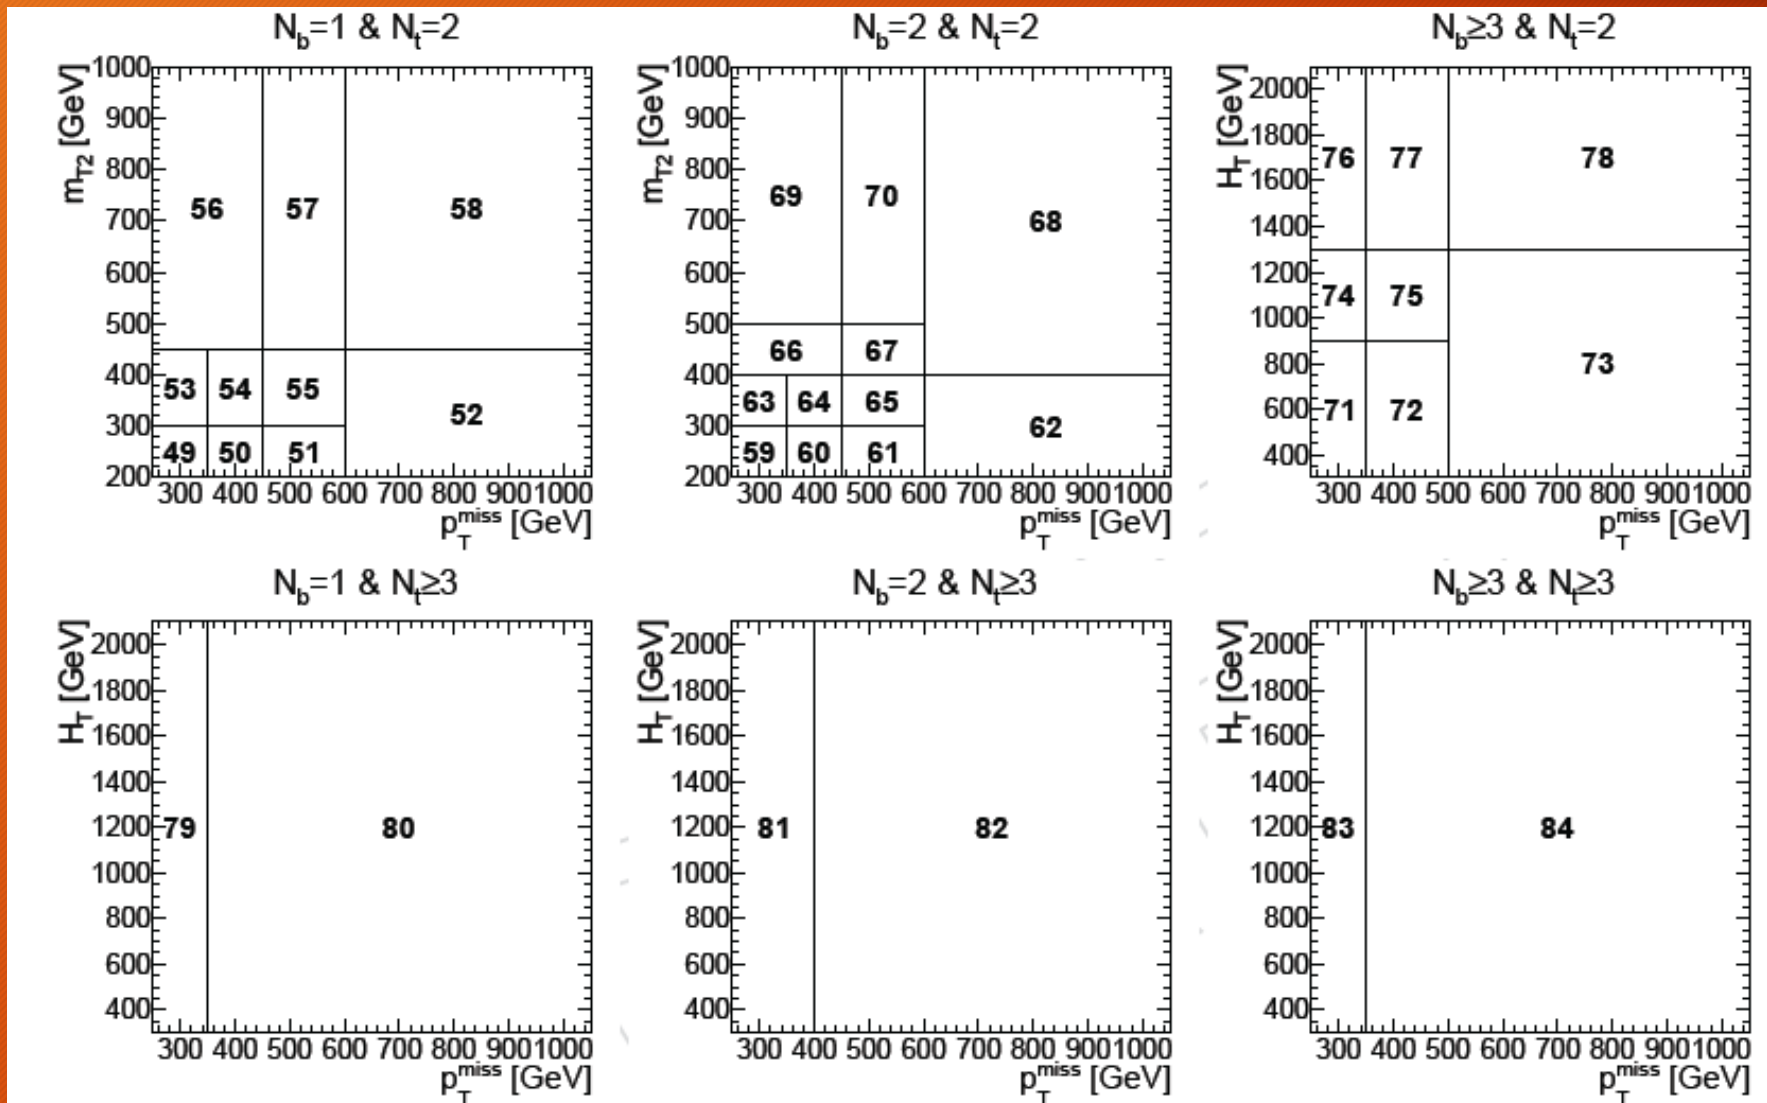

$$m_{\tilde{l}}^2 \geq m_T^2(\mathbf{p}_{Tl}, \mathbf{p}_{T\tilde{\chi}}) \equiv m_l^2 + m_{\tilde{\chi}}^2 + 2(E_{Tl}E_{T\tilde{\chi}} - \mathbf{p}_{Tl} \cdot \mathbf{p}_{T\tilde{\chi}}). \quad (8)$$

Search bins detail

- 84 search bins in N_b , N_t , pT_{miss} , $MT2/HT$
- N_b , $N_t=1,2$: Targeting T2tt, each block is binned in pT_{miss} , $MT2$
- N_b or $N_t \geq 3$: Targeting T1tttt, each block is binned in pT_{miss} , HT

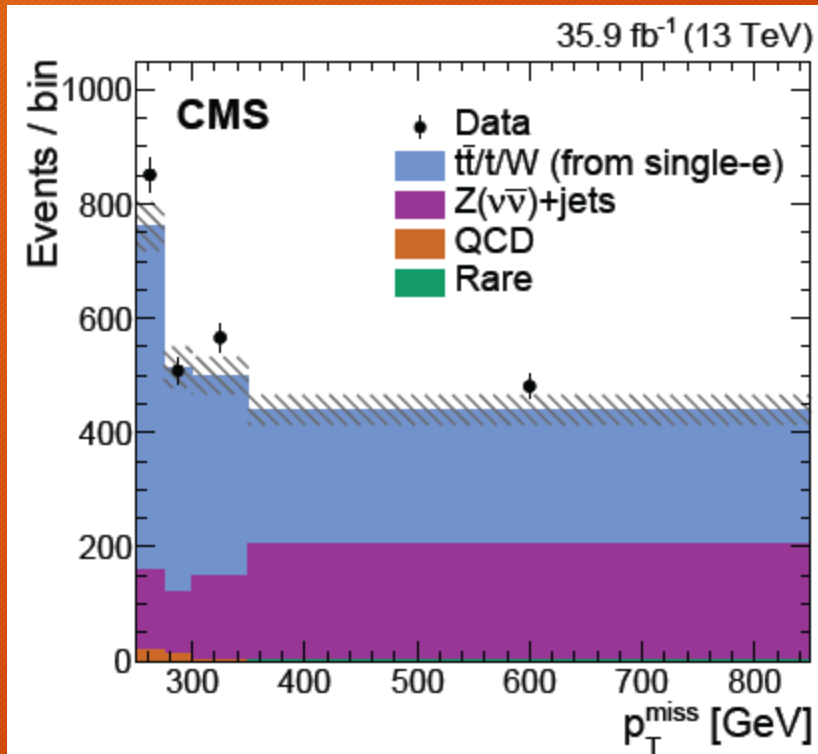

Search bins detail

LL validation

- Data sideband selected using full baseline selection except $N_b \geq 2$, $N_t = 0$, and a stricter cut to reduce QCD of $\Delta\phi(p_T^{\text{miss}}, j_{1,2,3,4}) > 0.5$
- Cross-check shows good agreement in both electron and muon channels

Electron Channel

Muon Channel
