

LHCb Run 2 & (Mostly) Run 1 Results

See Hassan Jawahery's talk for many hot new results

Dark matter & Majorana v's

Dark Photons?

- One of the most important questions in modern physics is that of the composition of dark matter
- One possible manifestation is described by the oxymoron "dark photon (A')," where the coupling to the EM current is suppressed by a factor of ε, compared with γ's
- A' can be produced promptly or have finite lifetimes, especially if is ε small
- A' can decay into $\mu^+\mu^-$, just like $\gamma \rightarrow \mu^+\mu^-$

A' Trigger

- New low mass dimuon trigger. Only online reconstructed tracks are kept, not "raw" event
- Trigger output from 1.6/fb of "turbo" data

USLUA, Nov. 2, 2017

USLUA, Nov. 2, 2017

Projected Run III Reach

For A' masses $< 2m(\mu)$ use $\gamma \rightarrow e^+e^-$

7

Majorana v's

- Are v's Fermions or Majorana particles, i.e. are they there own antiparticles?
- Several ways of looking for presence of heavy v's (N) in heavy quark decays if they are Majorana & couple to "ordinary" v's
- Modes analogous to v–less nuclear β decay

Simplest Channels: $B^{-} \rightarrow D^{+} \ell^{-} \ell^{\prime -} \& B^{-} \rightarrow D^{*+} \ell^{-} \ell^{\prime -} \ell^{\prime -} \ell^{-} \ell^{-} \& \ell^{\prime -} can be$ $e^{-}, \mu^{-} \text{ or } \tau^{-}.$

Limits on D(*)+e-e'-

- Upper limits in
 e⁻e⁻ mode not
 competitive with
 nuclear β decay
- Others unique since measure coupling of Majorana v to µ⁻

Mode	Exp.	u. I. x 10 ⁻⁶
B⁻→D ⁺ e⁻e⁻	Belle	< 2.6
B⁻→D ⁺ e⁻µ⁻	Belle	< 1.8
$B^- \rightarrow D^+ \mu^- \mu^-$	Belle	< 1.0
$B^- \rightarrow D^+ \mu^- \mu^-$	LHCb	< 0.69
B ⁻ →D* ⁺ μ ⁻ μ ⁻	LHCb	< 3.6

LHCb Phys.Rev. D85 (2012) 112004, 0.4/fb

Belle [arXiv:1107.064]

On-Shell v

W⁻

μ

b

u

- Can also look for Majorana v (N), where N→W⁺µ⁻
- A. Atre, T. Han,
- S. Pascoli, & B. Zhang [arXiv:0901.3589]
- Many other ways of searching:
 - **□** K⁻→π⁻N
 - □ μ⁻→e⁻γ
 - \Box $\tau^- \rightarrow \mu^+ \pi^- \pi^-$
 - •••••

 π^+ , D_S^+

LHCb search as a function of Majorana mass and lifetime, *Phys.Rev.Lett.* 112 (2014) 131802

Revised limits from Shuve & Peskin Phys.Rev. D94 (2016), 113007

Hidden sector bosons

- Consider an object χ that couples to $t\bar{t} \& \mu^+\mu^-$
- can be anything

& there are specific

models for axion, [LNP 741 (2008) 3]

or inflaton [JHEP 05 (2010) 10]

In these searches allow for prompt or $\boldsymbol{\chi}$ with finite lifetimes

Thy: arXiv:0911.4938, arXiv:0912.0390, arXiv:1303.4395

 θ^2 is inflaton coupling to the SM fields via mixing with the Higgs

USLUA, Nov. 2, 2017

Charmed Strange Baryons

Why study?

What is the structure of baryons, do di-quarks dominate? Implications for pentaguarks, tetraquarks.... Need to understand QCD

Measured masses & Γ

Resonance	Mass~(MeV)	$\Gamma (MeV)$	Yield	N_{σ}
$\Omega_c(3000)^0$	$3000.4 \pm 0.2 \pm 0.1^{+0.3}_{-0.5}$	$4.5 \pm 0.6 \pm 0.3$	$1300 \pm 100 \pm 80$	20.4
$\Omega_c(3050)^0$	$3050.2 \pm 0.1 \pm 0.1^{+0.3}_{-0.5}$	$0.8\pm0.2\pm0.1$	$970 \pm 60 \pm 20$	20.4
		$< 1.2\mathrm{MeV}, 95\%$ CL		
$\Omega_{c}(3066)^{0}$	$3065.6 \pm 0.1 \pm 0.3^{+0.3}_{-0.5}$	$3.5 \pm 0.4 \pm 0.2$	$1740 \pm 100 \pm 50$	23.9
$\Omega_c(3090)^0$	$3090.2 \pm 0.3 \pm 0.5^{+0.3}_{-0.5}$	$8.7\pm1.0\pm0.8$	$2000\pm140\pm130$	21.1
$\Omega_{c}(3119)^{0}$	$3119.1 \pm 0.3 \pm 0.9^{+0.3}_{-0.5}$	$1.1\pm0.8\pm0.4$	$480 \pm 70 \pm 30$	10.4
		$<2.6\mathrm{MeV},95\%$ CL		
$\Omega_c(3188)^0$	$3188 \pm 5 \pm 13$	$60 \pm 15 \pm 11$	$1670 \pm 450 \pm 360$	

- Why are these states so narrow? Explained by cs diquark?
- Which states are they? Need J^P
- Are they really css states, or are they pentaquarks?

and the second

A doubly charmed baryon

- Here we look for a baryon with quark content: ccu, called the \(\mathbb{E}_{cc}^{++}\)
- Selex measured the isospin partner (ccd) at a mass of 3518.87±1.7 MeV using a Σ^- beam in the $\Lambda_c^+K^-\pi^+$ decay mode
- Not confirmed by Focus, BaBar, Belle

- & consistent with theoretical expectations
- Can be explained with cc diquark orbited by u quark
 USLUA, Nov. 2, 2017 [PRL 119 (2017) 112001]

Exotics

USLUA, Nov. 2, 2017

Detailed history

One or two new resonant states claimed

Year	exp. (/fb)	# B ⁻	mass (MeV)	Γ (MeV)	σ	mass (MeV)	Г (MeV)	σ
2008	CDF (2.7)	58±10	4143.0	11.7	3.8			
2009	Belle	325±21	4143 fix	11.7 fix	1.9			
2011	CDF (6.0)	115±12	4143.4	15.3	5.0	4274.4	32.3	3.1
2011	LHCb (0.37)	346±20	4143.4 fix	15.3 fix	ul	4274.4 fix	32.3 fix	
2013	CMS (5.2)	2480±160	4148.0	28.0	5.0	4313.8	38	
2013	D0 (10.4)	215±37	4159.0	19.9	3.1	4328.5	30 fix	
2014	Babar (422)	189±14	4143.4 fix	15.3 fix	1,6	4274.4 fix	32.3 fix	1.2

New LHCb (3/fb)

- LHCb has 4289±150 events [arXiv:1406.0755]
- Again do a full amplitude fit including interferences between B⁻→J/ ψ K^{*-}, K^{*-}→ ϕ K⁻, and B⁻→X⁰K⁻, X⁰→J/ $\psi\phi$.
- B⁻→φZ⁻, Z⁻→J/ψK⁻ is also included in the amplitude fit, but used only as a source of systematic uncertainty

Results of fit: m(\u00f6K)

Phys.Rev.Lett. 118 (2017) 022003

Results of fit

• J^P also measured all with >4 σ significances

Particle	JP	Signif- icance	Mass (MeV)	Г (MeV)	Fit Fraction (%)	
X(4140)	1+	8.4 σ	$4146.5 \pm 4.5^{+4.6}_{-2.8}$	$83 \pm 21^{+21}_{-14}$	$13.0 \pm 3.2^{+4.8}_{-2.0}$	
X(4274)	1+	6.0 σ	$4273.3 \pm 8.3^{+17.2}_{-3.6}$	$56 \pm 11^{+8}_{-11}$	7.1 \pm 2.5 ^{+3.5} _{-2.4}	
X(4500)	0+	6.1 σ	$4506 \pm 11^{+12}_{-15}$	$92 \pm 21^{+21}_{-20}$	$6.6 \pm 2.4_{-2.3}^{+3.5}$	
X(4700)	0+	5.6 σ	$4704 \pm 10^{+14}_{-24}$	$120 \pm 31^{+42}_{-33}$	$12 \pm 5^{+9}_{-5}$	
NR	0+	6.4 σ			$46 \pm 11^{+11}_{-21}$	
USLUA, Nov. 2, 2017 29						

Model with 2 P_c's

Do a full amplitude fit. No solution with zero or one P_c states. Best fit has two states, masses 4380±30 MeV, & 4450±3 MeV with J^P=(3/2⁻,

5/2⁺), also (3/2⁺, 5/2⁻) & (5/2⁺, 3/2⁻) are allowed

- Need to find new states & new decay modes
- Many predicted, e.g. $P_c \rightarrow \Lambda_c D^*$, $\eta_c p$ high multiplicity final states

Conclusions

- LHCb is looking for physics beyond the standard model in many new areas
- These searches are enhanced by use of special software triggers that use the online data as the final sample. This will be greatly enhanced in the upgrade as the "hardware" trigger will go away
- Many properties of LHCb make these searches unique: particle ID, muon detection to low p_T, etc...

The bsud tetraquark

- D0 announced a new state on 24 Feb: $X(5568) \rightarrow B_s \pi$ arXiv:1602.07588
- CERN seminar 21 March (Monday)
- High production rate and significance of 5.1sigma
- Generated several citations \rightarrow investigation by other collaborations

B** states at LHCb
