# Beam Dump Facility

## Related talks at HPTW 2018

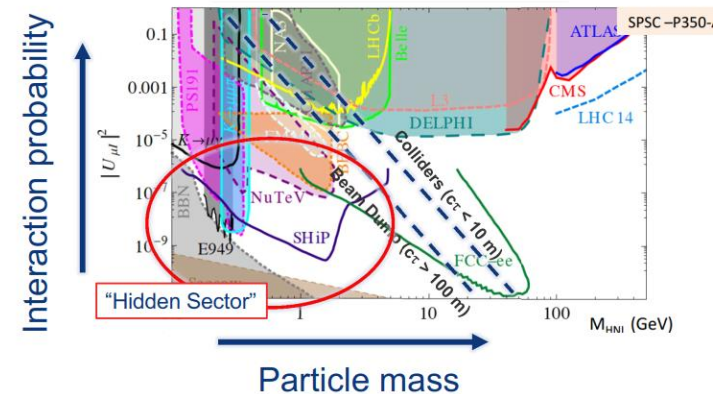

- **M. Lamont**, *Physics Beyond Colliders at CERN*, Fri 8/6
- **H. Vincke**, *Beam Dump Facility (BDF) at CERN radiological and environmental assessment*, Thu 7/6
- **K. Kershaw**, *Preliminary design study of the integration and remote handling processes for the Beam Dump Facility Target Complex*, Thu 7/6

# The Beam Dump Facility (BDF)

- General purpose fixed target facility
- Proposed location: **SPS North Area**
- Currently on design phase
- **Search for Hidden Particles (SHiP)** experiment first user of the facility

What can be done in a Beam Dump Facility that cannot be done in a collider?

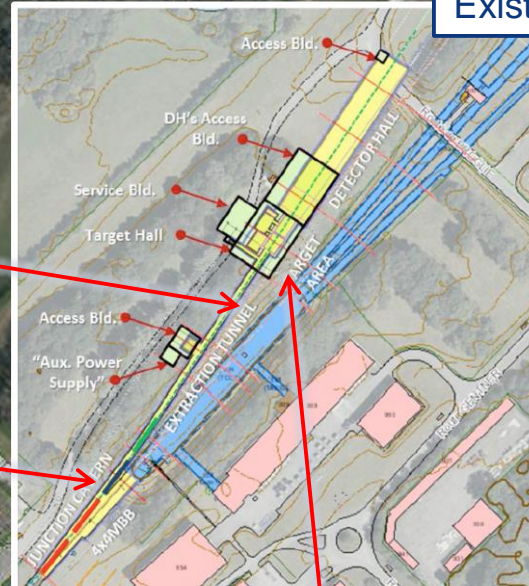

**M. Lamont, Physics beyond colliders at CERN, Friday 8<sup>th</sup>**

**Civil engineering**  
Geotechnical and hydrogeology of site

**New beam line**  
Beam dilution

**Construction of junction cavern**  
Switching into new beam-line

Existing users

## Beam Dump Facility challenges

**Radiation protection of personnel and environment**

**Safe exploitation**

Very high residual dose rates next to the target and to the cast iron shielding  
**O(100) Sv/h (1 week cooling)**

**Target and target complex**  
**355 kW average power**  
**2.5 MW pulsed power**

*H. Vincke, RP aspects, Thursday 7<sup>th</sup>*

*K. Kershaw, BDF Target complex, Thursday 7<sup>th</sup>*

**Beam delivery by SPS**  
**Slow extraction with acceptable losses**

# Operational conditions

<u>Baseline characteristics</u>	
Proton momentum	<b>400 GeV/c</b>
Beam intensity	$4.0 \cdot 10^{13}$ p+/cycle
Cycle length	7.2 s
Spill duration (slow extraction)	1.0 s
Average beam power deposited on target	<b>320 kW</b>
Average beam power on target during spill	2.3 MJ

⇒ Challenging target design

- **Dilution of the beam** by the upstream magnets
  - Beam dilution optimization:
    - Target mechanical performance
    - Magnets aperture limits
  - 50 mm radius, 4 turns in 1 second
- **Large beam spot:** 8 mm  $1\sigma$

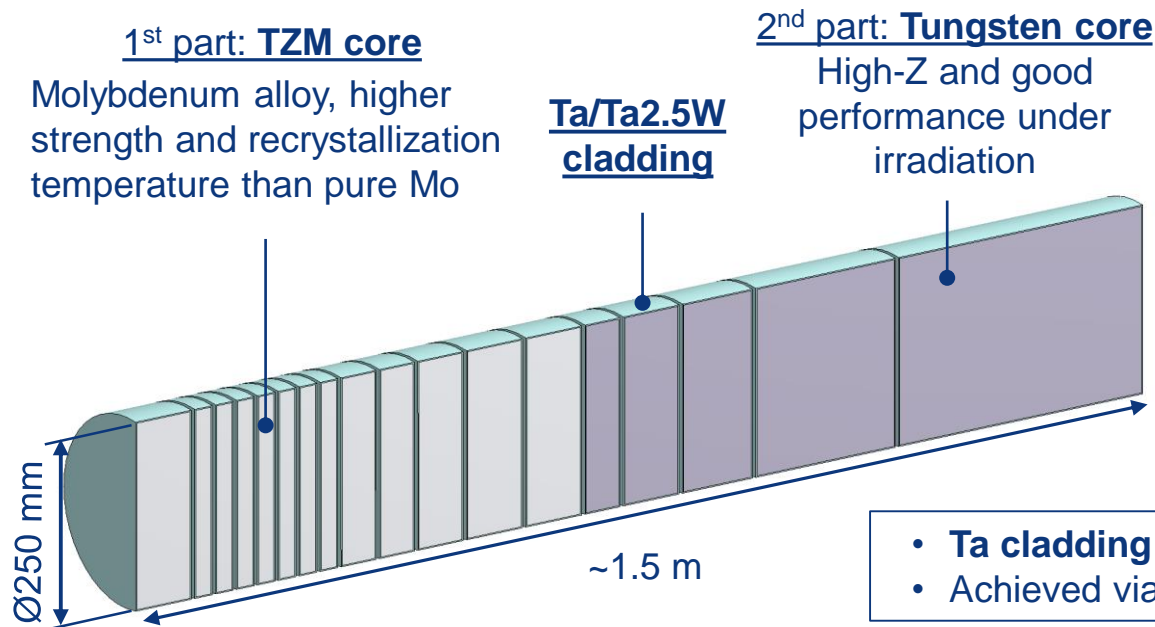

# Beam Dump Facility target

- Main functions:
  - **Full SPS 400 GeV/c beam absorption** → **Target/dump**
  - Maximize the production of **charmed mesons** → physics performance
- Material requirements:
  - **High-Z materials**
  - **Short interaction length**

Increase the reabsorption of pions and kaons

- **250 mm diameter cylinders**
- **Total length ~ 1.5 m**
- **Optimized segmentation** of the target to minimize the level of temperatures and stresses
- High power deposition
  - forced water cooling required
  - 5 mm gap between the blocks

- **Ta cladding** to avoid corrosion/erosion effects
- Achieved via **Hot Isostatic pressing (HIPing)**

# Target assembly design

- Target inner tank
  - Supports target core blocks
  - Encloses the target cooling system
- Target outer tank
  - Water-leak tightness
  - Provides interfaces with water and electrical connectors

- Target tank enclosed inside a Helium containing box
  - Dry environment + leak monitoring
  - **Replacement of the whole box in case of target failure**
  - **Compatible with target complex handling and integration design**

Target outer tank

*K. Kershaw's talk Thursday 7th*

# Cooling circuit design

- Water flows through 5 mm gap between the target blocks
  - Cooling of circular face of the blocks critical  
→ beam impact
- Preliminary design of the target cooling circuit

- Homogenous water speed in the channels ~ **5 m/s**
- Average **Heat Transfer Coefficient** ~ **20000  $\text{W/m}^2\text{K}$**
- Minimized **mass flow rate: 10 kg/s**
- Pressure supply: **20 bar**
  - Increase water boiling temperature above  $200^\circ\text{C}$
  - Avoid vapor formation in contact with target blocks

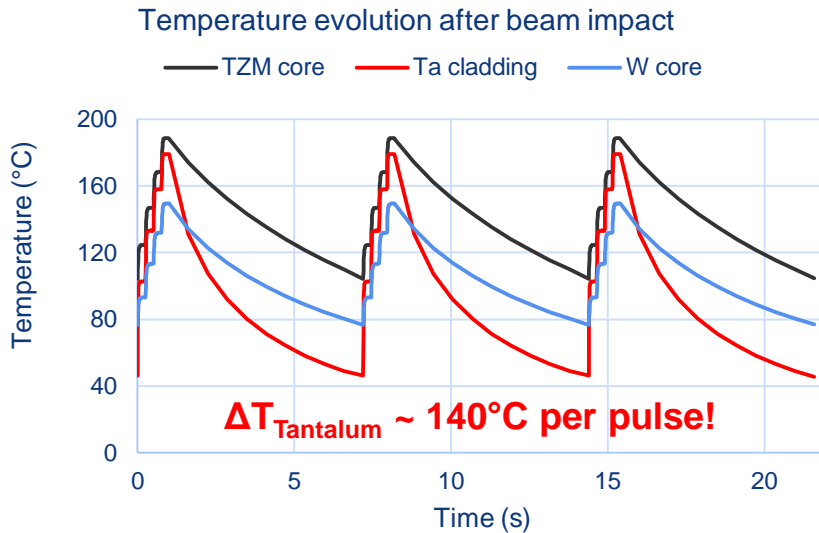

**2 parallel streams in series**  
→ avoid cooling failure in case of blockage of one channel

# Thermo-mechanical calculations

O: Transient Thermal TZM#4 8mm beam

Max Von Mises  
 equivalent stress Ta  
 cladding ~110 MPa

- High raise of temperature during beam impact: **temperature limitations in the Ta cladding** → vapor formation, plastic deformation of the cladding
- The high temperatures reached lead to a high level of stresses
- Properties of **pure Ta** at high temperatures reduced significantly with respect to RT → chosen **cladding material: tantalum-tungsten alloy, Ta2.5W**

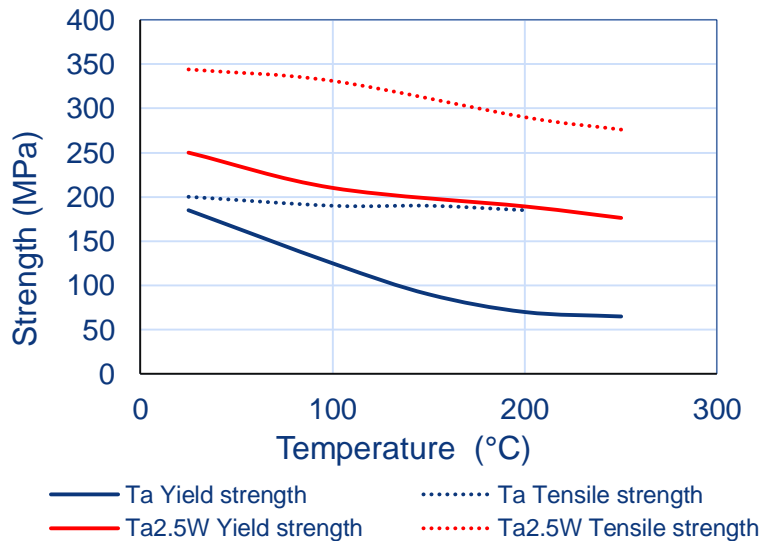

# Material R&D – Use of Ta2.5W

- **Target cladding material: Ta2.5W**

- 2.5% content of W
- Similar thermal properties to Ta

- Good corrosion-erosion resistance
- **Higher strength, specially at high temperatures**

Ta and Ta2.5W strength comparison

Cladding material	Maximum Von Mises eq. stress expected	Yield strength	Safety factor
Tantalum (preliminary design)	110 MPa	80 MPa (at 180°C)	<b>0.7 X</b>
Ta2.5W (new design)	110 MPa	<b>200 MPa (at 180°C)</b>	<b>1.8 ✓</b>

Additional considerations:

- **Fatigue properties for 10<sup>7</sup> cycles**
- **Radiation damage (ongoing)**

- **Bonding quality** with tungsten and TZM expected to be the same

# Material R&D

**J. Busom Descarrega, Recent developments of HIP[...] (poster)**

- Initial HIP cycle tests**

**D. Wilcox et al., Stress levels and failure modes of tantalum-clad tungsten targets at ISIS, Journal of nuclear materials**

- New HIP cycle tests**  
(different temperature and pressure)

- Bonding achieved between Ta2.5W and TZM
    - Interfacial strength = 260 MPa ~ yield strength of Ta2.5W, very good results
  - No bonding achieved between Ta2.5W and W
  - Bonding achieved between Ta2.5W and TZM
    - Interfacial strength = 325 MPa ✓
  - Bonding achieved between Ta2.5W and W
    - Interfacial strength = 200 MPa ✓
- ⇒ Promising results for future BDF target cladding materials

# BDF target prototype beam tests

- **A prototype of the BDF target** will be tested under beam in the North Area of CERN in **September/October 2018**
  - Dedicated beam during 3 periods of 10 hours →  **$10^4$  cycles** approx.
- Motivation for the test:
  1. **Reproduce the level of temperatures and stresses of the final target**
    - High intensity beam (up to  **$10^{13}$  protons**) from SPS
    - **Slow extraction**: 1s pulse, 7.2 period
    - 3 mm  $1\sigma$  beam, **non-diluted**
  2. **Crosscheck the FEM calculations performed**
    - Several instrumented blocks: strain gauges, optical fibers, Pt100
  3. **Post Irradiation Examination after irradiation**
    - Remote opening and extraction of the blocks

# BDF target prototype assembly

- Target prototype assembly:
  - Installed upstream existing beryllium targets
  - Surrounded by concrete shielding

**Placed on motorized support**  
→ Removed from beam after operation

- Fully compatible with remote handling
  - Lifting of the target for removal
  - Remote disconnection of the interfaces
  - Radiation level  $O(\text{Sv/h})$  after 2 months

# BDF target prototype design

- **Reduced scale prototype**

- Same total length (~1.5 m)
- Reduced diameter (**80 mm**)
- Same block length distribution
- TZM/W core, Ta/TaW cladding

- **Two concentric tanks**

(~ final BDF target)

- Outer tank:
  - Leak tightness
  - Connections interface
- Inner tank: two half shells
  - Target core blocks holder
  - Enclosing cooling circuit

### Von Mises Equivalent stress Ta2.5W cladding

**Reasonable approximation of the level of stresses in the core and cladding materials**

# Post Irradiation Examination

- After 6 months cool-down remote extraction of several target blocks for **Post Irradiation Examination** (100 mSv/h at 10 cm)
  - Microscopic analysis on **bonding surfaces**
  - Hardness and microstructure analysis around the **impact point**
  - Micromechanical tests on **irradiated targets** → material weakening
  - Profilometry/metrology to identify **swelling effects** on target blocks

# Conclusions

- A new **Beam Dump Facility** is proposed to be installed at CERN's SPS North Area.
- The **BDF target is one of the most challenging aspects** of the new facility.
- The BDF target design involves a complex material selection process and important mechanical constraints.
- **Material R&D on-going**: new target materials and bonding of refractory metals.
- A **prototype of the BDF target** will be tested at CERN in 2018
- The prototype test under beam will aim to **reproduce the operational conditions of the final BDF target**.
