Disaster Recovery on Steroids

Wednesday, 14 May 2008 11:00 (40 minutes)

The Idaho National Laboratory (INL) has recently completed a multiyear Disaster Recovery (DR) project to ensure rapid recovery in the event of natural disasters, catastrophic hardware failures, or unforeseen events requiring near immediate resumption of service.

The INL identified a DR location 50 miles from the Idaho Falls production data center which is located at the INL high mountain desert facility. The DR strategy includes real-time replication of 12 TB of production data, tape backups to DR location, shadow image instances, and application development environment
