## Analysis of systematic error in hadronic vacuum polarization contribution to muon g-2

Tuesday, 24 July 2018 16:50 (20 minutes)

We present a systematic study of finite size correction and cut-off effect in hadronic vacuum polarization contribution to muon g-2 with two volumes,  $5.4~\rm fm^3$  and  $10.8~\rm fm^3$ , and two lattice cut-off,  $2.33~\rm GeV$  and  $3.06~\rm GeV$ , at the physical pion on the PACS configuration. In this analysis, using high statistics data, we compare two volumes at long-distance on the physical point to directly estimate the finite size correction, and it then makes a comparison with ChPT prediction. Using the different cut-off scales on ~10.8 fm³ lattice box, we try to estimate the cut-off effect with local and point-splitting operators on the two cut-off configurations.
