

## Nucleon form factors from $N_f=2+1+1$ twisted mass fermions at the physical point

*Friday, 27 July 2018 17:50 (20 minutes)*

We present results on the nucleon form factors including disconnected contributions using an ensemble of  $N_f=2+1+1$  twisted mass fermions with a clover term. The ensemble has a spatial extent of 5.12fm ( $64^3 \times 128$ ). Techniques such as the summation and the two-state fits have been employed to control possible excited states contamination.
