## Modified Top and Bottom Yukawa Couplings

## Based on the following works :

- M. Carena, I. Low, N. Shah, C.W., arXiv: I3 I0.2248, JHEP I404 (2014)
- M. Carena, H. Haber, I. Low, N. Shah, C.W., arXiv:I4I0.4969, PRD9I (20I5); arXiv:I5I0.09I37, PRD93 (2016)
- M. Badziak, C.W., arXiv:I602.06I98, JHEP I605 (2016); arXiv: I6|I.02353, JHEP I702 (20I7)
- D. Liu, I. Low, C.Wagner, arXiv:I703.0779I, PRD96 (20I7)
- A. Joglekar, M. Li, P. Huang, C.W., arXiv: I7I I.05743, to appear in PRD.
- N. Coyle, B. Li, C.W., arXiv: I802.09I22

## Modified Couplings ?

- Today, we know that the observed Higgs Boson couples to top and bottom quarks.
- The values of the couplings are within a few tens of percents of the SM values (at least in modulus).
- In the presence of new Higgs states at the weak scale, something I consider likely, the couplings will not coincide with the SM ones.
- I will discuss the impact of such modifications and how they appear in New Physics Models.

## New thh results

Values overall consistent with the SM, within a few tens of percent

Things have changed in an interesting way :
There is today evidence of a Higgs decaying to bottom quarks

Errors are still large an admit deviations of a few tens of percent from the SM results

## Impact of Modified Couplings

- In general, assuming modified couplings, and no new light particle the Higgs can decay into, the new decay branching ratios are given by

$$
B R(h \rightarrow X X)=\frac{\kappa_{X}^{2} B R(h \rightarrow X X)^{\mathrm{SM}}}{\sum_{i} \kappa_{i}^{2} B R(h \rightarrow i)^{\mathrm{SM}}}
$$

- For small variations of (only) the bottom coupling, and $X \neq b$

$$
\begin{gathered}
B R(h \rightarrow b \bar{b}) \simeq B R(h \rightarrow b \bar{b})^{\mathrm{SM}}\left(1+0.4\left(\kappa_{b}^{2}-1\right)\right) \\
B R(h \rightarrow X X) \simeq B R(h \rightarrow X X)^{\mathrm{SM}}\left(1-0.6\left(\kappa_{b}^{2}-1\right)\right) \\
\frac{B R(h \rightarrow b \bar{b})}{B R(h \rightarrow X X)}=\frac{B R(h \rightarrow b \bar{b})^{\mathrm{SM}}}{B R(h \rightarrow X X)^{\mathrm{SM}}}\left(1+\left(\kappa_{b}^{2}-1\right)\right)
\end{gathered}
$$

- So, due to the its large contribution to the Higgs decay width, a modification of a bottom coupling leads to a large modification of all other decay branching ratios (larger than the one into bottoms !)
- Observe that the coefficients are just given by the SM bottom decay branching ratio and its departure from one.

Modified couplings in 2HDMs

## Modifying the top and bottom couplings in two Higgs Doublet Models

- Measurement of the top and bottom couplings still subject to large errors.
- The enhancement on the top coupling is somewhat weaker in the 13 TeV data. Modifications of a few tens of percent possible.
- Modifying the top-quark coupling is simple for small values of $\tan \beta$, but the bottom coupling is modified as well in an opposite direction

$$
\begin{array}{cl}
h=-\sin \alpha H_{d}^{0}+\cos \alpha H_{u}^{0} & \kappa_{t}=\sin (\beta-\alpha)+\cot \beta \cos (\beta-\alpha) \\
H=\cos \alpha H_{d}^{0}+\sin \alpha H_{u}^{0} & \kappa_{b}=\sin (\beta-\alpha)-\tan \beta \cos (\beta-\alpha) \\
& \kappa_{V}=\sin (\beta-\alpha) \simeq 1 \\
\tan \beta=\frac{v_{u}}{v_{d}} &
\end{array}
$$

Alignment Condition :

$$
\cos (\beta-\alpha)=0
$$

SM-like Higgs tree level couplings equal to SM couplings

## $H$ and A Decay to Boson Pairs

Suppressed at Alignment
$\underset{H}{H}$

## Deviations from Alignment

$$
c_{\beta-\alpha}=t_{\beta}^{-1} \eta, \quad s_{\beta-\alpha}=\sqrt{1-t_{\beta}^{-2} \eta^{2}} \quad \begin{aligned}
h & =-\sin \alpha H_{d}^{0}+\cos \alpha H_{u}^{0} \\
H & =\cos \alpha H_{d}^{0}+\sin \alpha H_{u}^{0}
\end{aligned}
$$

The couplings of down fermions are not only the ones that dominate the Higgs width but also tend to be the ones which differ at most from the SM ones

$$
\begin{aligned}
& g_{h V V} \approx\left(1-\frac{1}{2} t_{\beta}^{-2} \eta^{2}\right) g_{V}, \quad g_{H V V} \approx t_{\beta}^{-1} \eta g_{V}, \\
& g_{h d d} \approx(1-\eta) g_{f}, \quad \quad g_{H d d} \approx t_{\beta}\left(1+t_{\beta}^{-2} \eta\right) g_{f} \\
& g_{\text {huu }} \approx\left(1+t_{\beta}^{-2} \eta\right) g_{f}, \quad g_{\text {Huu }} \approx-t_{\beta}^{-1}(1-\eta) g_{f}
\end{aligned}
$$

For small departures from alignment, the parameter $\eta$ can be determined as a function of the quartic couplings and the Higgs masses

$$
\begin{gathered}
\eta=s_{\beta}^{2}\left(1-\frac{\mathcal{A}}{\mathcal{B}}\right)=s_{\beta}^{2} \frac{\mathcal{B}-\mathcal{A}}{\mathcal{B}}, \quad \mathcal{B}-\mathcal{A}=\frac{1}{s_{\beta}}\left(-m_{h}^{2}+\tilde{\lambda}_{3} v^{2} s_{\beta}^{2}+\lambda_{7} v^{2} s_{\beta}^{2} t_{\beta}+3 \lambda_{6} v^{2} s_{\beta} c_{\beta}+\lambda_{1} v^{2} c_{\beta}^{2}\right) \\
\tilde{\lambda}_{3}=\lambda_{3}+\lambda_{4}+\lambda_{5} \\
\mathcal{B}=\frac{\mathcal{M}_{11}^{2}-m_{h}^{2}}{s_{\beta}}=\left(m_{A}^{2}+\lambda_{5} v^{2}\right) s_{\beta}+\lambda_{1} v^{2} \frac{c_{\beta}}{t_{\beta}}+2 \lambda_{6} v^{2} c_{\beta}-\frac{m_{h}^{2}}{s_{\beta}}
\end{gathered}
$$

## Down Couplings in the MSSM for low values of $\mu$

(c) In this regime, $\lambda_{6,7} \simeq 0$, and

$$
\begin{aligned}
& \lambda_{1} \simeq-\tilde{\lambda}_{3}=\frac{g_{1}^{2}+g_{2}^{2}}{4}=\frac{M_{Z}^{2}}{v^{2}} \simeq 0.125 \quad \lambda^{\mathrm{SM}} \simeq 0.26 \quad \lambda_{7} \propto \frac{A_{t} \mu}{M_{S}^{2}}\left(1-\frac{A_{t}^{2}}{6 M_{S}^{2}}\right) \\
& \lambda_{2} \simeq \frac{M_{Z}^{2}}{v^{2}}+\frac{3}{8 \pi^{2}} h_{t}^{4}\left[\log \left(\frac{M_{\mathrm{SUSY}}^{2}}{m_{t}^{2}}\right)+\frac{A_{t}^{2}}{M_{\mathrm{SUSY}}^{2}}\left(1-\frac{A_{t}^{2}}{12 M_{\mathrm{SUSY}}^{2}}\right)\right]
\end{aligned}
$$

Carena, Low, Shah, C.W.'I3

All vector boson branching ratios suppressed by enhancement of the bottom decay width

$$
t_{\beta} c_{\beta-\alpha} \simeq \frac{-1}{m_{H}^{2}-m_{h}^{2}}\left[m_{h}^{2}+m_{Z}^{2}+\frac{3 m_{t}^{4}}{4 \pi^{2} v^{2} M_{S}^{2}}\left\{A_{t} \mu t_{\beta}\left(1-\frac{A_{t}^{2}}{6 M_{S}^{2}}\right)-\mu^{2}\left(1-\frac{A_{t}^{2}}{2 M_{S}^{2}}\right)\right\}\right]
$$

Carena, Haber, Low, Shah, C.W.' I4
M. Carena, I. Low, N. Shah, C.W.'I3

## Higgs Decay into Gauge Bosons

Mostly determined by the change of width

Small $\mu$

$$
\mu / M_{\mathrm{SUSY}}=2, \quad A_{t} / M_{\mathrm{SUSY}} \simeq 3
$$

CP-odd Higgs masses of order 200 GeV and $\tan \beta=10 \mathrm{OK}$ in the alignment case

## Heavy Supersymmetric Particles

## Heavy Higgs Bosons : A variety of decay Branching Ratios

## Carena, Haber, Low, Shah, C.W.'I4

$$
m_{h}^{\text {alt }}: \text { Large } \mu \text {. Alignment at values of } \tan \beta \simeq 12
$$

Depending on the values of $\mu$ and $\tan \beta$ different search strategies must be applied.

At large $\tan \beta$, bottom and tau decay modes dominant.
As $\tan \beta$ decreases decays into SM-like Higgs and wek bosons become relevant

## Naturalness and Alignment in the NMSSM

## see also Kang, Li, Li,Liu, Shu'I3, Agashe,Cui,Franceschini' I3

- It is well known that in the NMSSM there are new contributions to the lightest CP-even Higgs mass,

$$
\begin{gathered}
W=\lambda S H_{u} H_{d}+\frac{\kappa}{3} S^{3} \\
m_{h}^{2} \simeq \lambda^{2} \frac{v^{2}}{2} \sin ^{2} 2 \beta+M_{Z}^{2} \cos ^{2} 2 \beta+\Delta_{\tilde{t}}
\end{gathered}
$$

- It is perhaps less known that it leads to sizable corrections to the mixing between the MSSM like CP-even states. In the Higgs basis, ( correction to $\lambda_{4}$ )

$$
\begin{aligned}
M_{S}^{2}(1,2) & \simeq \frac{1}{\tan \beta}\left(m_{h}^{2}-M_{Z}^{2} \cos 2 \beta-\lambda^{2} v^{2} \sin ^{2} \beta+\delta_{\tilde{t}}\right) \\
\delta \tilde{\lambda}_{3} & =\lambda^{2} \quad \cos (\beta-\alpha) \simeq-M_{S}^{2}(1,2) /\left(m_{H}^{2}-m_{h}^{2}\right)
\end{aligned}
$$

- The last term is the one appearing in the MSSM, that are small for moderate mixing and small values of $\tan \beta$
- The values of $\lambda$ end up in a very narrow range, between 0.65 and 0.7 for all values of $\tan$ (beta), that are the values that lead to naturalness with perturbativity up to the GUT scale

$$
\lambda^{2}=\frac{m_{h}^{2}-M_{Z}^{2} \cos 2 \beta}{v^{2} \sin ^{2} \beta}
$$

## Alignment in the NMSSM (heavy or Aligned singlets)

(iii)

(iv)

## Carena, Low, Shah, C.W.'I3

It is clear from these plots that the NMSSM does an amazing job in aligning the MSSM-like CP-even sector, provided
$\lambda$ is about 0.65

# Decays into pairs of SM-like Higgs bosons suppressed by alignment

Yellow: $\tan \beta=3$

Carena, Haber, Low, Shah, C.W.'I5

# More on Top Quark and Bottom Quark Couplings Modifications 

## What is the problem in 2HDM ?

## Suppression of the gluon fusion rate ?

Would expect top rate to be suppressed as well ! No evidence of that in data, although errors are too large to tell.

## The Gluon Fusion Rate

- Suppression of the bottom coupling would demand some suppression of the gluon-Higgs coupling.
- Problem is even more severe when the top coupling is enhanced, since we have to compensate for this potential source of ggh enhancement

$$
\begin{aligned}
& \kappa_{t}=\sin (\beta-\alpha)+\cot \beta \cos (\beta-\alpha) \\
& \kappa_{b}=\sin (\beta-\alpha)-\tan \beta \cos (\beta-\alpha) \\
& \kappa_{V}=\sin (\beta-\alpha) \simeq 1
\end{aligned}
$$

- However, the gluon fusion cross section could also be modified in the presence of extra color particles. For instance, for scalar tops,

$$
\frac{\kappa_{g}}{\kappa_{g}^{\mathrm{SM}}} \simeq \kappa_{t}\left[1+\frac{m_{t}^{2}}{4}\left(\frac{1}{m_{\tilde{t}_{1}}^{2}}+\frac{1}{m_{\tilde{t}_{2}}^{2}}-\frac{X_{t}^{2}}{m_{\tilde{t}_{1}}^{2} m_{\tilde{t}_{2}}^{2}}\right)\right]
$$

## Minimal Composite Models

D. Liu, I. Low, C.W.'17

Difficult to enhance the top coupling without enhancing at the same time the gluon coupling

## Connection with Di-Higgs Production

Frederix et al'14

Very few events in the SM case after cuts are implemented.
Light Stops or small modifications of the top quark coupling (or both) can strongly enhance the di-Higgs production rate.

## Variation of the Di-Higgs Cross Section with the Top Quark and Self Higgs Couplings

Huang, Joglekar, Li, C.W.'17

Strong dependence on the value of kt and $\lambda 3$
Even small variations of kt can lead to 50 percent variations of the di-Higgs cross section

$$
\begin{aligned}
V= & m_{11}^{2} \Phi_{1}^{\dagger} \Phi_{1}+m_{22}^{2} \Phi_{2}^{\dagger} \Phi_{2}-m_{12}^{2}\left(\Phi_{1}^{\dagger} \Phi_{2}+\text { h.c. }\right)+\frac{1}{2} \lambda_{1}\left(\Phi_{1}^{\dagger} \Phi_{1}\right)^{2}+\frac{1}{2} \lambda_{2}\left(\Phi_{2}^{\dagger} \Phi_{2}\right)^{2} \\
& +\lambda_{3}\left(\Phi_{1}^{\dagger} \Phi_{1}\right)\left(\Phi_{2}^{\dagger} \Phi_{2}\right)+\lambda_{4}\left(\Phi_{1}^{\dagger} \Phi_{2}\right)\left(\Phi_{2}^{\dagger} \Phi_{1}\right) \\
& +\left\{\frac{1}{2} \lambda_{5}\left(\Phi_{1}^{\dagger} \Phi_{2}\right)^{2}+\left[\lambda_{6}\left(\Phi_{1}^{\dagger} \Phi_{1}\right)+\lambda_{7}\left(\Phi_{2}^{\dagger} \Phi_{2}\right)\right] \Phi_{1}^{\dagger} \Phi_{2}+\text { h.c. }\right\}
\end{aligned}
$$

## Inverting the sign of the bottom coupling

$$
\begin{gathered}
t_{\beta} c_{\beta-\alpha} \approx 2 \\
{\left[\left(\lambda_{3}+\lambda_{4}+\lambda_{5}\right)-\lambda_{2}+\lambda_{7} t_{\beta}\right] v^{2} \simeq 2\left(m_{H}^{2}-m_{h}^{2}\right) .}
\end{gathered}
$$

N. Coyle, B. Li, C.W.' arXiv:1802.09122

## Couplings: Resolved Loops

Parameter value

## What about inverting the sign of the third generation couplings?

- Easy to invert the bottom coupling in type II Higgs doublet models
- In the NMSSM, in particular, this implies to go to larger values of lambda, since this is the parameter that allows to control this coupling.

$$
t_{\beta} c_{\beta-\alpha} \approx \frac{-1}{m_{H}^{2}-m_{h}^{2}}\left[\left(m_{h}^{2}+m_{Z}^{2}-\lambda^{2} v^{2}\right)+\frac{3 m_{t}^{4} A_{t} \mu t_{\beta}}{4 \pi^{2} v^{2} M_{S}^{2}}\left(1-\frac{A_{t}^{2}}{6 M_{S}^{2}}\right)\right]
$$

- This causes problems with the spectrum, since some scalars tend to become tachyonic in the relevant region of parameters. We cured this problem by adding a tadpole term

$$
\Delta V=\xi_{S} S+\text { h.c. } \quad \delta \lambda_{2} \simeq \frac{\lambda^{4}}{16 \pi^{2}} \ln \left(\frac{m_{S}^{2}}{\mu^{2}}\right) \simeq \frac{\lambda^{4}}{16 \pi^{2}} \ln \left(\left|\frac{\lambda \xi_{S}}{\mu^{3}}\right|\right)
$$

- Since the Higgs-gauge boson coupling with respect to the SM is $\sin (\beta-\alpha)$, one needs sizable values of $\tan \beta$, and moderate values of $m_{H}$, but still allowed by searches for non-standard Higgs bosons. Values of $\tan \beta \simeq 7-10$ are the most appropriate ones.

## Effects on gluon Fusion

- Changing the sign of the bottom coupling changes the gluon fusion rate by about 12 percent !
- Assuming that no other effect is present, the LHC collaborations announce a precision of about 5 percent for the gluon coupling by the end of the LHC run. So, under this assumption this effect may be tested.

## CMS Combination

D. Sperka's talk, Moriond EW

## Dibosons from Gluon Fusion

Signal Mostly Enhanced, due to Gluon Fusion Coupling Enhancement.
Values of order the SM values are possible, depending on the exact value of the bottom coupling.

## Additional tests of this idea ?

## Radiative Higgs Decays

Bodwin et al'14, Neubert et al'15

$$
\begin{aligned}
& \Gamma[H \rightarrow \Upsilon(1 S)+\gamma]=\left|(3.33 \pm 0.03)-(3.49 \pm 0.15) \kappa_{b}\right|^{2} \times 10^{-10} \mathrm{GeV} \\
& \Gamma[H \rightarrow \Upsilon(2 S)+\gamma]=\left|(2.18 \pm 0.03)-(2.48 \pm 0.11) \kappa_{b}\right|^{2} \times 10^{-10} \mathrm{GeV}
\end{aligned}
$$

Accidental cancellation present in the SM would lead to a large enhancement in the case of a change in sign of the bottom coupling to Higgs bosons.

## LHC Sensitivity

Branching ratios are small and therefore the number of events become only sizable at high luminosities. The approximate number of events are

$$
\begin{aligned}
& \text { For } \kappa_{b}=-1 \\
& B R(H \rightarrow \Upsilon(1 S)+\gamma) \simeq 1.1 \times 10^{-6} \\
& B R(H \rightarrow \Upsilon(2 S)+\gamma) \simeq 0.5 \times 10^{-6} \\
& B R(H \rightarrow \Upsilon(3 S)+\gamma) \simeq 0.4 \times 10^{-6}
\end{aligned}
$$

| $\kappa_{b}$ | $\Upsilon(1 S)$ | $\Upsilon(2 S)$ | $\Upsilon(3 S)$ |
| :---: | :---: | :---: | :---: |
|  | Run $2\left(130 \mathrm{fb}^{-1}\right)$ |  |  |
| 1 | $0.00442 \pm 0.06214$ | $0.0155 \pm 0.0483$ | $0.0178 \pm 0.0414$ |
| -1 | $8.02 \pm 0.32$ | $3.75 \pm 0.15$ | $2.73 \pm 0.11$ |
|  | Run $3\left(300 \mathrm{fb}^{-1}\right)$ |  |  |
| 1 | $0.0102 \pm 0.1434$ | $0.358 \pm 0.1115$ | $0.0408 \pm 0.0956$ |
| -1 | $18.5 \pm 0.7$ | $8.65 \pm 0.36$ | $6.31 \pm 0.26$ |

Therefore, at most a few hundred of events available in these channels.

Run I bound on the Branching ratios of order of a few $10^{-3}$. Improvement in search sensitivity will be required to reach the required sensitivity at the HL-LHC.

## More general Parameters : Superpotential Tadpole

One may reduce the mass gap with the charged Higgs, and due to the large misalignment, decays into Higgs and gauge bosons open up.

B. Li, N. Coyle, C.W. '18

## Consistent with ATLAS Excess

## Conclusions

- Current Higgs measurements are in agreement with the values predicted in the SM.

Q Determination of bottom and top couplings still lacks precision, with a few tens of percent errors. Therefore, relevant modifications of these couplings may be present.

Q Bottom coupling governs the width and therefore its departure from SM values leads to a relevant modification of all decay widths.
(9) An interesting, even if unlikely, possibility is that the sign of this coupling is inverted.

Q In this talk, after discussing the alignment condition, we have also explored scenarios in which relevant modifications of the bottom coupling may be present, in well motivated low energy supersymmetry extensions of the SM

- Relevant implications for Higgs phenomenology, that go beyond the modifications of the decay widths, and may allow to test these scenarios.

Light Charginos and Neutralinos can significantly modify M the CP-odd Higgs Decay Branching Ratios

## Carena, Haber, Low, Shah, C.W.'I4

At small values of $\mu$ ( $M_{2} \simeq 200 \mathrm{GeV}$ here), chargino and neutralino decays prominent. Possibility constrained by direct searches.

## Complementarity between precision measurements and search for new Higgs going to T pairs

Carena, Haber, Low, Shah, C.W. I I4

Limits coming from measurements of $h$ couplings become weaker for larger values of $\mu$
$-\sum_{\phi_{\mathrm{i}}=\mathrm{A}, \mathrm{H}} \sigma\left(\mathrm{bb} \phi_{\mathrm{i}}+\mathrm{gg} \phi_{\mathrm{i}}\right) \times \mathrm{BR}\left(\phi_{\mathrm{i}} \rightarrow \tau \tau\right)(8 \mathrm{TeV})$
--- $\sigma(\mathrm{bbh}+\mathrm{ggh}) \times \mathrm{BR}(\mathrm{h} \rightarrow \mathrm{VV}) / \mathrm{SM}$

Limits coming from direct searches of $H, A \rightarrow \tau \tau$ become stronger for larger values of $\mu$

Bounds on $m_{A}$ are therefore dependent on the scenario and at present become weaker for larger $\mu$

With a modest improvement of direct search limit one would be able to close the wedge, below top pair decay threshold

## Search for (psudo-)scalars decaying into lighter ones

CMS-PAS-HIG-15-001

It is relevant to perform similar analyses replacing the Z by a SM Higgs !

## Stop Effects on Di-Higgs Production Cross Section

Orange : Stop corrections to kappa_g decoupled Red : X_t fixed at color breaking vacuum boundary value, for light mA Green : X_t fixed at color breaking boundary value, for $\mathrm{mA}=1.5 \mathrm{TeV}$ Blue : Same as Red, but considering kappa_t = 1.1

## Values of the dimensionless couplings

B. Li, N. Coyle, C.W. '18

Necessary values to invert the bottom coupling

## Low charged Higgs masses

Part of the reason for large value of $\lambda$ is the relation between the CP-odd and charged Higgs masses in these theories, namely

$$
m_{H^{+}}^{2} \simeq m_{A}^{2}-\lambda^{2} v^{2} \quad v=174 G e V
$$

Constraints on Charged Higgs Mass coming from $t \rightarrow b H^{+}$considered

## Novelty: Decay into charged Higgs Bosons

Large values of $\lambda$ imply that the charged Higgs mass becomes significantly lower than the neutral MSSM-like Higgs masses.
