Tuning of Dynamic Bump Orbit

Separatrices with Dynamic Bump Orbit

Dynamic Bump Orbit
(which determines the center
of the stable region)
must be synchronized with the
betatron tune
(which determines the size of
the stable region)

Tuning in 2017-May~June RUN

In 2017-May~June RUN we had to re-adjust the dynamic bump orbit because ESS configuration was drastically changed due to ribbon trouble

In such a case we start from fixed bump orbit to find correspondence between tune and bump orbit angle which minimize beam loss

Separatrices with Fixed Bump Orbit

Beam Loss with Fixed Bump Orbit

shot #3160
Fixed Bump -0.73 mrad

betatron tune is linearly ramped by lattice Q

Beam Loss with Fixed Bump Orbit

shot #3168
Fixed Bump -0.78 mrad

betatron tune is linearly ramped by lattice Q

Beam Loss with Fixed Bump Orbit

shot #3160
Fixed Bump -0.79 mrad

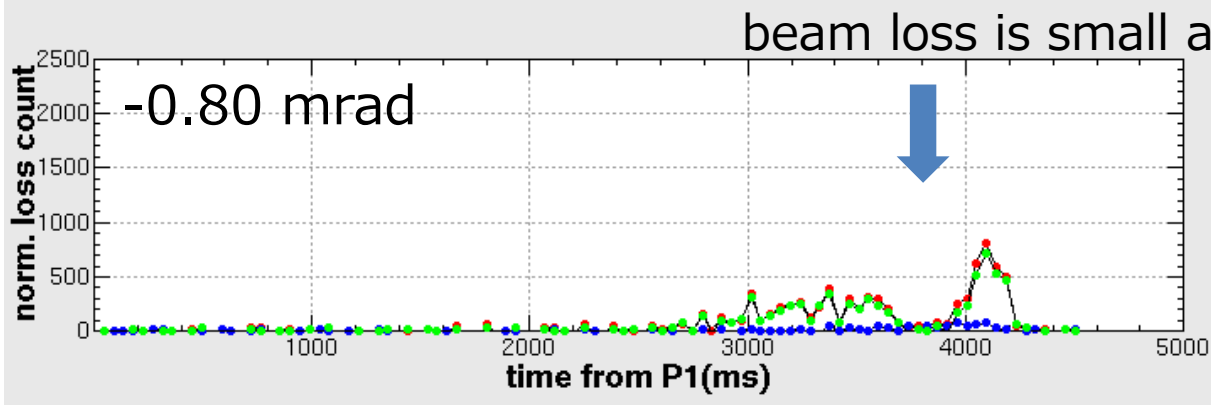

betatron tune is linearly ramped by lattice Q

Beam Loss with Fixed Bump Orbit

shot #3170
Fixed Bump -0.80 mrad

betatron tune is linearly ramped by lattice Q

Beam Loss with Fixed Bump Orbit

shot #3171
Fixed Bump -0.81 mrad

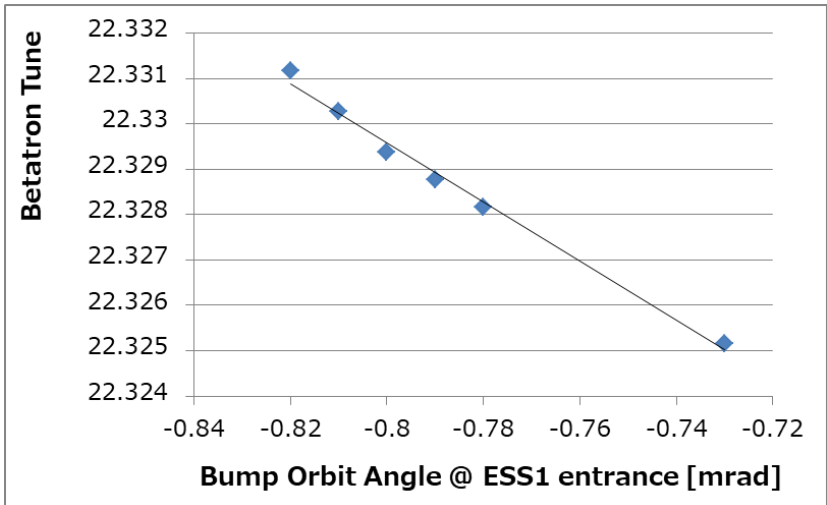

betatron tune is linearly ramped by lattice Q

→ we can deduce tune - angle correspondence which minimize beam loss

Result of Optimization

correspondence between tune and angle which minimize beam loss

note: vertical axis ranges for beam loss plots are much smaller than previous plots

Fine Tuning of Dynamic Bump Orbit

Tune Ramping by Lattice Q (Fixed Pattern)

Spill Feedback Q

Search the condition for minimum beam loss (start from measured/calculated values)

tune

bump orbit (angle at ESS1 entrance)

bump magnet current

Ext. Eff [%]

tune in dynamic bump calc.

Ext. Eff [%]

angle of the bump orbit [mrad]

Current Status

In 2018-Jan~Feb Run

Extraction Efficiency :

~99.5% with 50 kW
