

Quantum Link Lattice Field Theory

Friday, 14 September 2018 13:45 (25 minutes)

The quantum link approach to lattice field theory represents scalar, gauge and Dirac fields in terms of single bit/qbit fermion operators. This representation is universally equivalent to conventional lattice methods for asymptotically free 2D sigma models and 4D gauge theories. I will discuss the prospect for quantum links as a natural basis of quantum computing.

Presenter: Prof. BROWER, Richard C. (Boston University)

Session Classification: Session 7
