

Quantum Teleportation at Fermilab

Wednesday, September 12, 2018 3:05 PM (25 minutes)

The Fermilab Quantum NETWORK (FQNET) aims to produce a fully functional quantum network based initially on optical fibers with the capability to distribute time-bin photonic quantum states (qubits) across various distances by employing an intrinsic property of a multi-qubit system: entanglement. The resulting quantum network system will serve fundamental research and future R&D quantum communication technologies and protocols. Here we present the status of the system.

Presenters: SPIROPULU, Maria; Dr SINCLAIR, Neil (Caltech)

Session Classification: Session 3
