

Sidecars Future and Other Cavity Concepts

Thursday, 23 August 2018 16:10 (20 minutes)

The Sidecar experiment is a path finder experiment for higher frequency iterations of the ADMX experiment and is capable of producing competitive science results. The next generation of the Sidecar will feature a new form factor and be used to test design changes and new hardware. Cavity concepts for a third generation of the Sidecar experiment will also be discussed.
