It consists of fast frontends (read out data on every trigger) and periodic slow control frontends

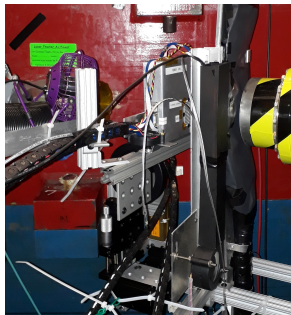

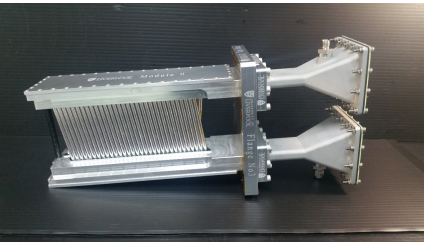

Introduction

Detectors

uTCA crate

20 GB/s

GPUs

200 MB/s

Backend PC

DQM

FTS/tape

Nearline

Clock and Controls System

The CCC provides the 40 MHz clock and the trigger to the uTCA crates over fibre

- 40 MHz clock continuously going to all uTCA crates (into the AMC13)
- Takes the accelerator trigger and sends the programmed trigger sequence to all fast frontends
- Every frontend must send back an event

TTC Trigger Sequencer Last Updated: 20/03/18 14:50:54

INDEX	PRE-TRIGGER GAP	TRIGGER TYPE

3	10000000 ns	4 Async	

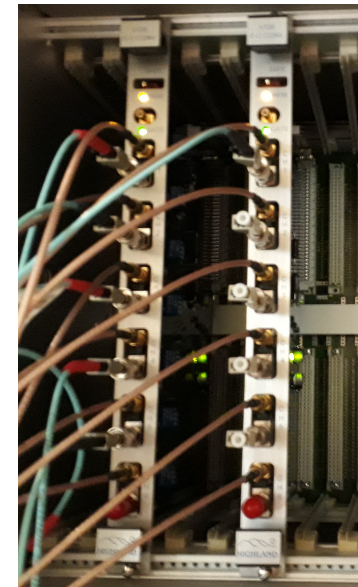

- Different trigger types can be responded to differently
- Feedback system means triggers can be throttled if one frontend is not keeping up

The system can also provide analog triggers which do not require a response

Triggers are used for the kickers, quads and laser systems

- Timings taken from accelerator signal with programmable width and delay
- Runs off a 450MHz clock for better timing accuracy

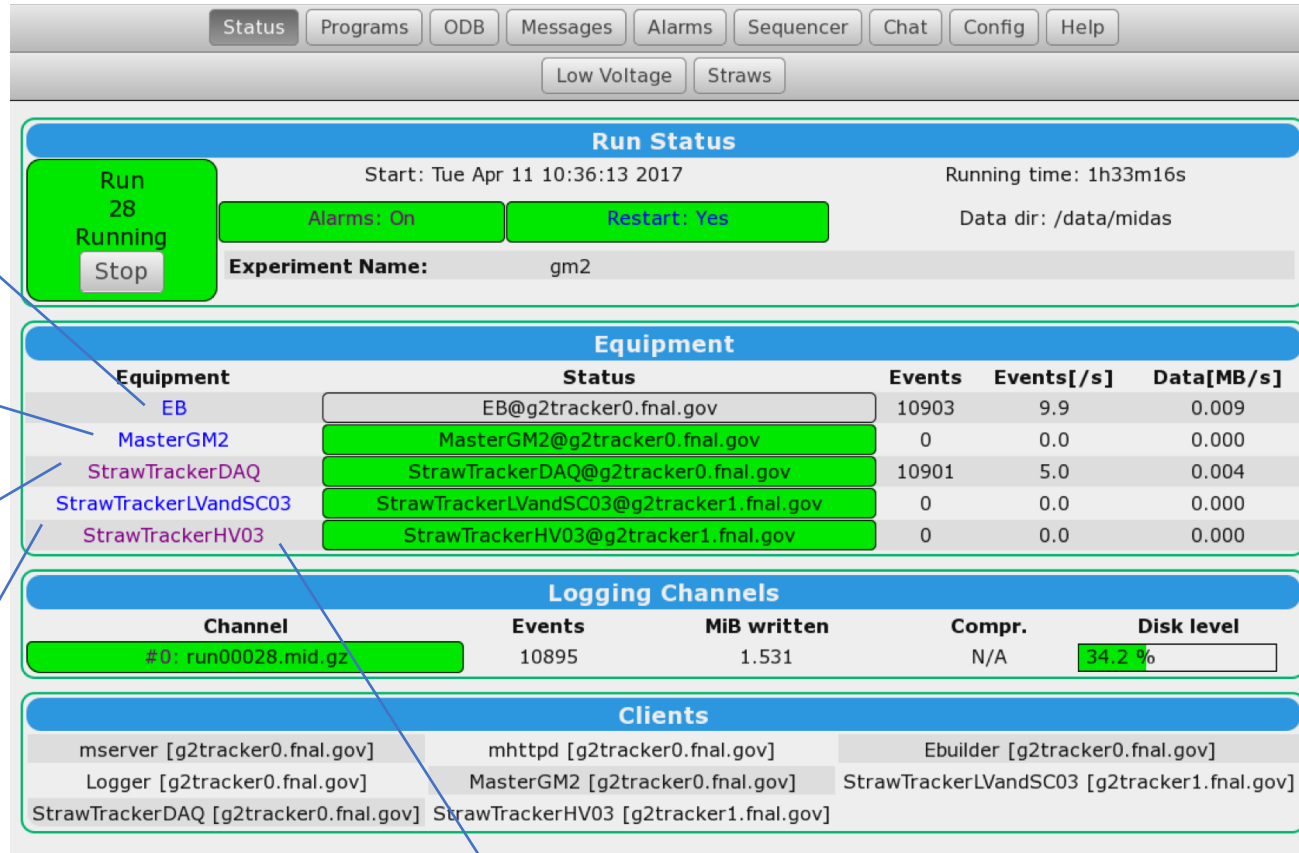

Event builder, combines the events from the different frontends

Master GM2
stores the trigger information
(begin of fill)

Straws frontend
collects the straws data into a MIDAS bank

Slow Controls frontend
records monitoring data
(currents, temperatures etc.)

High Voltage frontend
Monitors the high voltage supply and
issues an alarm if the HV trips

The screenshot shows the Straw Tracker DAQ system web interface. At the top, there are tabs for Status, Programs, ODB, Messages, Alarms, Sequencer, Chat, Config, and Help. Below these are buttons for Low Voltage and Straws. The main content area is divided into several sections:

- Run Status**: Shows a green 'Run 28 Running' button with a 'Stop' button below it. It also displays 'Start: Tue Apr 11 10:36:13 2017', 'Running time: 1h33m16s', 'Data dir: /data/midas', 'Alarms: On', 'Restart: Yes', and 'Experiment Name: gm2'.
- Equipment**: A table listing equipment and their status.
- Logging Channels**: A table showing logging channels and their status.
- Clients**: A table listing clients and their status.

Straw Tracker Readout Chain

The straw tracker DAQ has a hierarchical structure through the various layers of electronics

The straws are readout by **ASDQs** :

- 1 ASDQ board for 16 straws
- 8 ASDQ boards per tracker module

The data is passed to the **TDCs** :

- 2 TDCs per TDC board
- 1 TDC per ASDQ

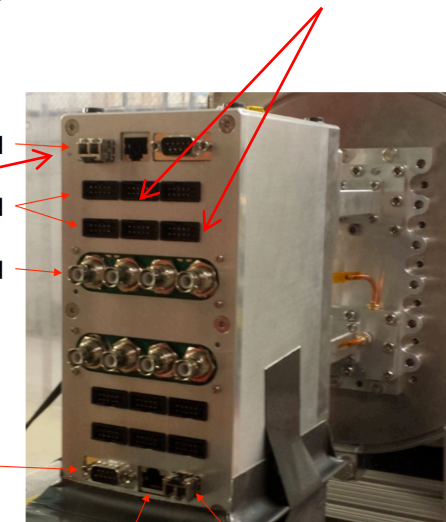

The **logic board** collates the data from 4 TDCs (2 LBs per tracker module)

Logic Board

TDC Board

HV Board

Power

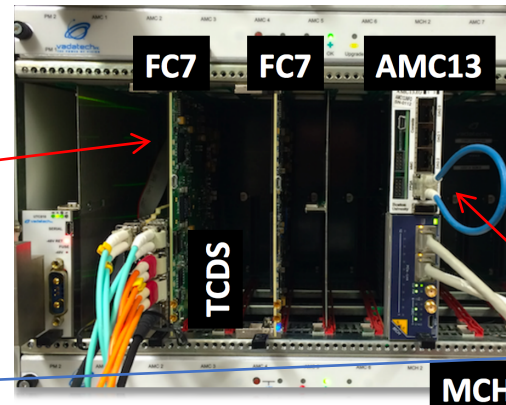

Slow Control

CLK/Data

The data from the logic board is passed to the **FC7** :

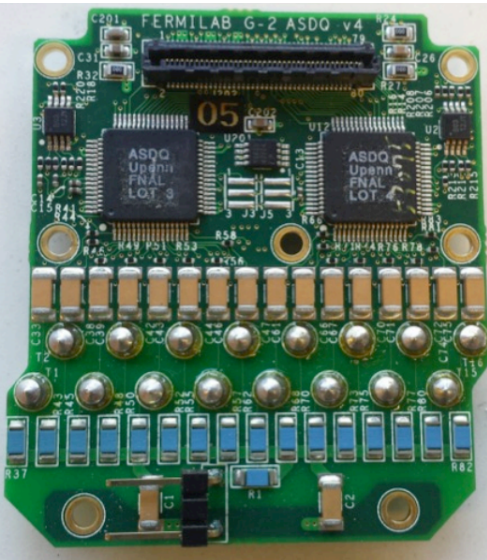

- Reads data from 16 logic boards
- 1 FC7 per tracker station

The data from all FC7s is passed to the **AMC13** and read into the **PC**

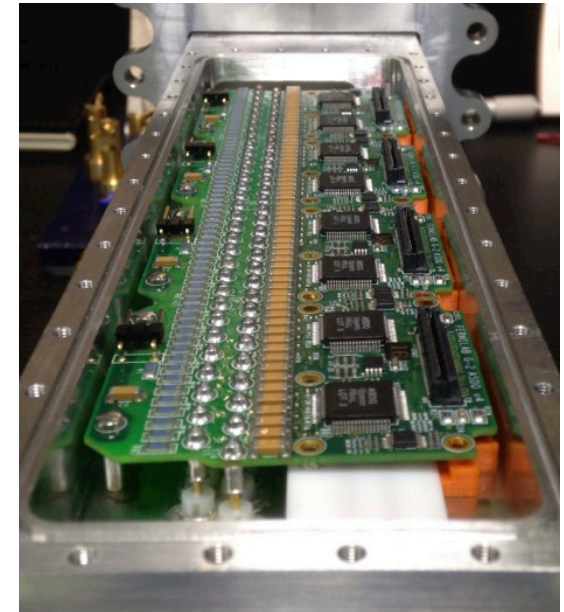

Tracker Frontend Readout

The tracker readout hardware consists of ASDQs, TDCs, Logic boards, FC7s and an AMC13

Straw Ends

Non-readout
pin cover

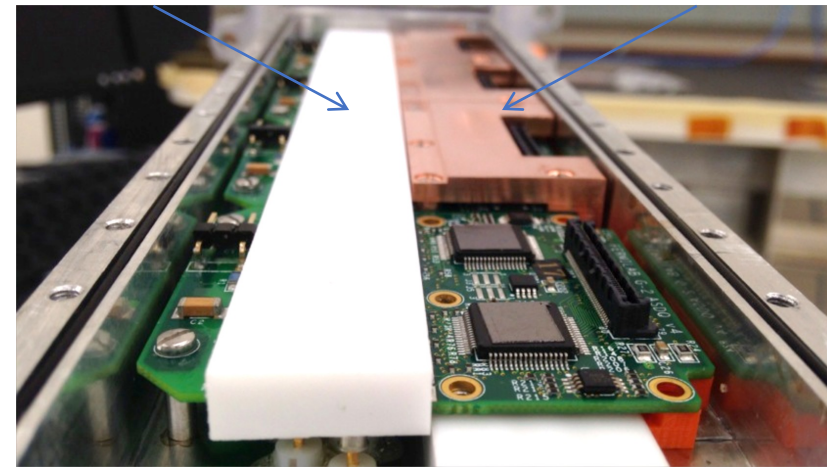

Socket cover

Cooling bar

The ASDQs plug onto the end of the straws :

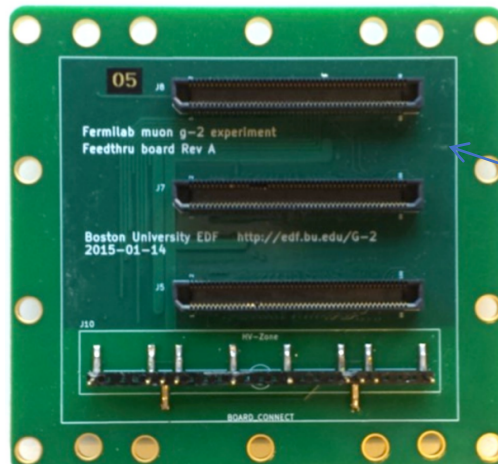

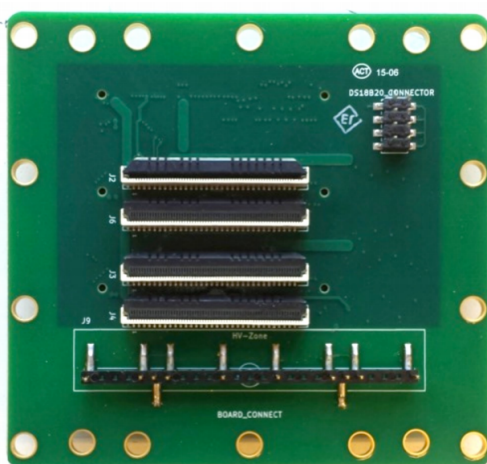

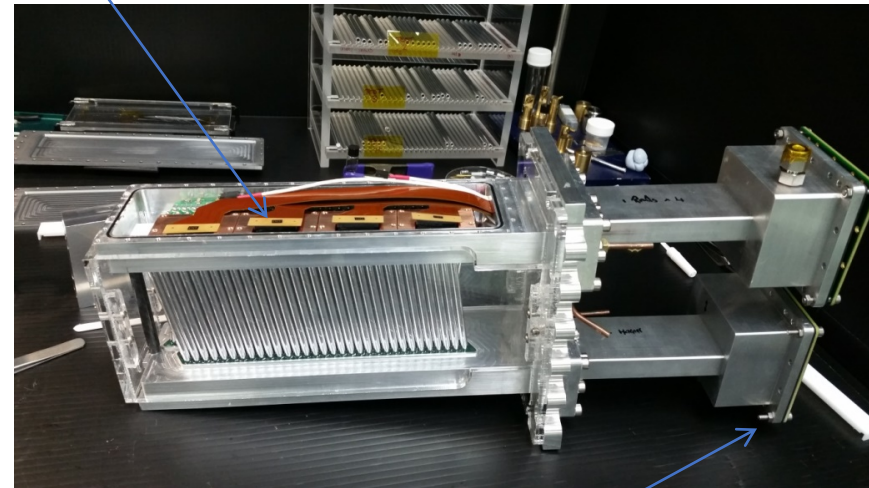

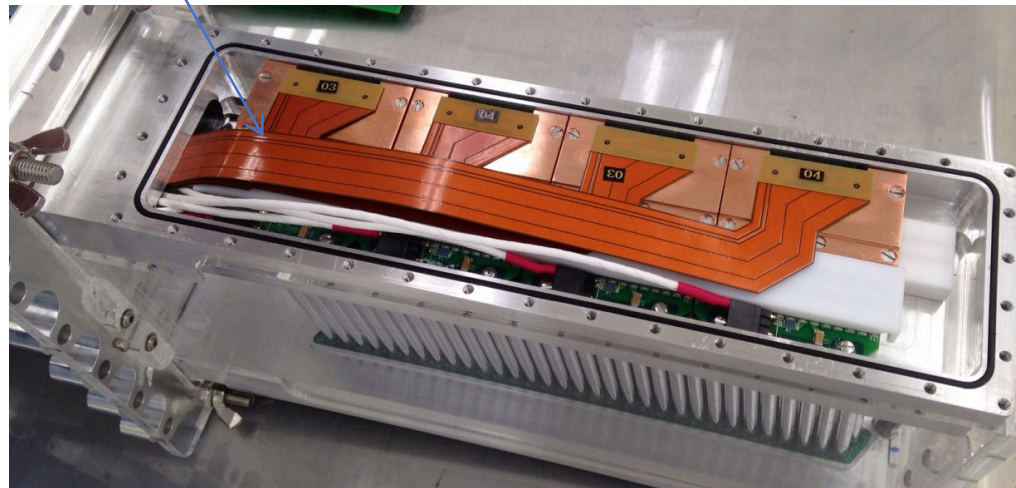

- 8 ASDQs per manifold (4 boards)
- Take care of pulse shaping, baseline restoration and discrimination
- Produce a digital output

Tracker Frontend Readout

The flexi cables plug onto the ASDQs :

- Provide power and reference voltages
- Carry the signal from the ASDQs

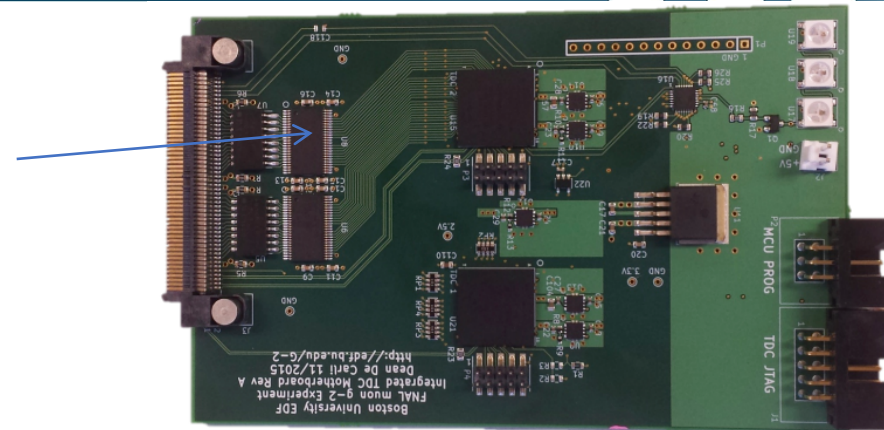

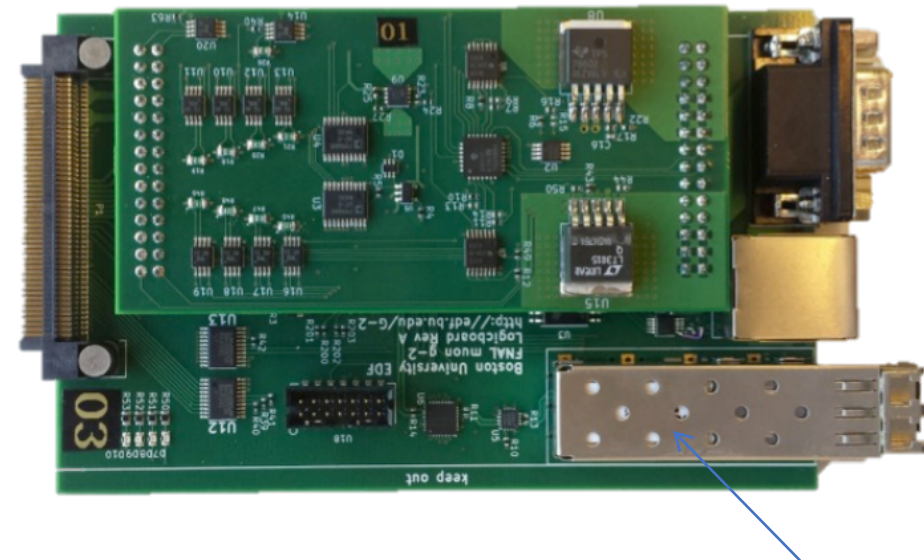

The flexi cables connect to the feedthru board :

- Forms the gas seal
- Acts as a backplane for the boards

Tracker Frontend Readout

The data is passed to the TDCs :

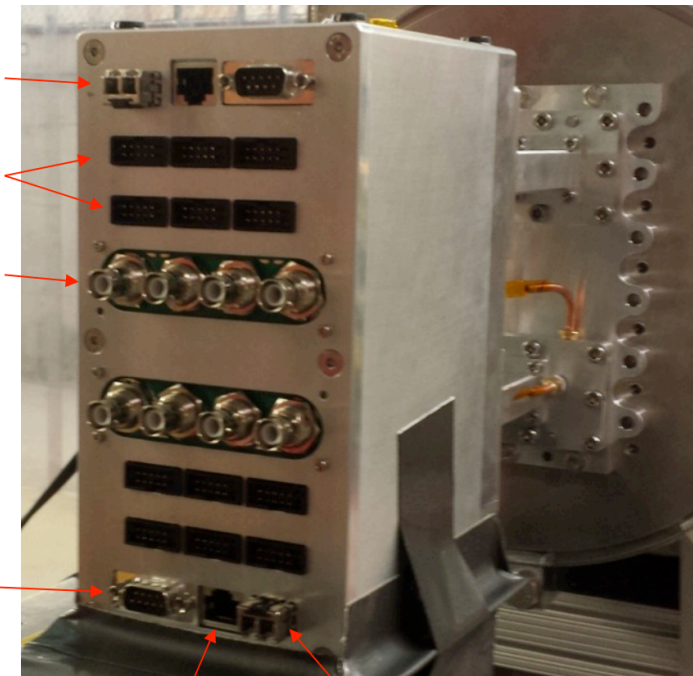

- 2 TDC boards per manifold each with 2, 16 channel FPGAs
- Convert the digital signals from the ASDQs

Logic Board

TDC Board

HV Board

Power

Slow Control

CLK/Data

The TDCs pass the data onto the logic boards :

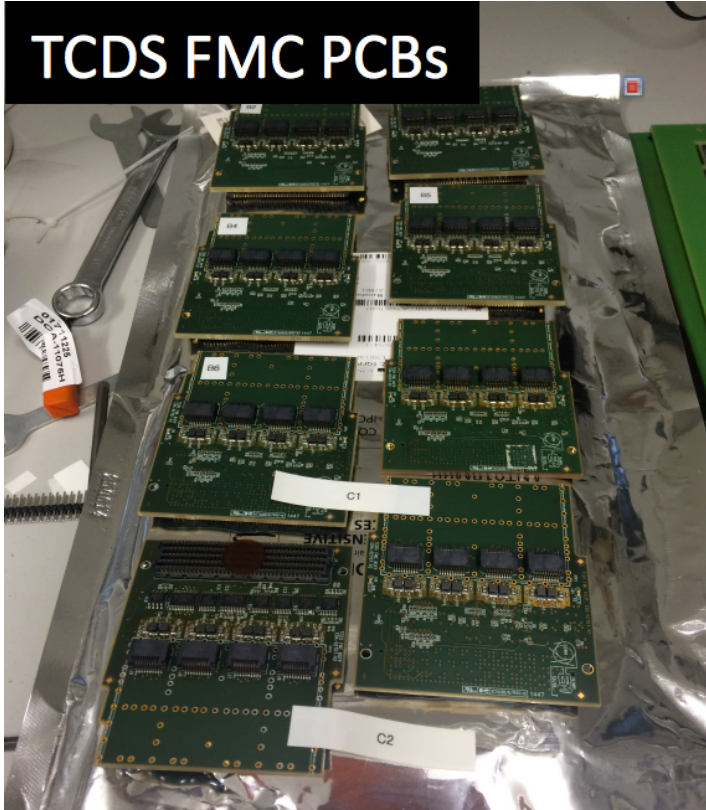

- Buffers and sends out the data from the TDCs
- Slow Control connection for programming settings and loading firmware
- Regulates voltages from $\pm 5V$ Low voltage input

Tracker Backend Readout

The data from the logic board is sent over fibre to the FC7 :

- Takes 16 fibre inputs (1 whole tracker station per FC7)
- Collects the data from all 16 Logic boards and sends it out
- Provides the clock to the logic board

TCDS FMC PCBs

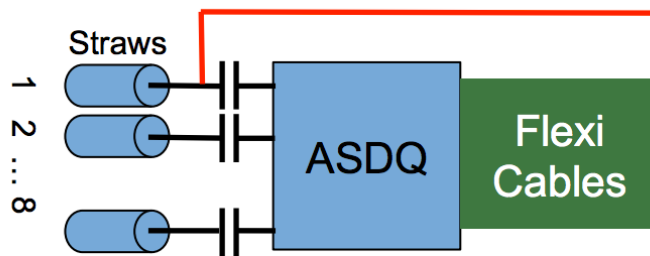

The FC7 sends the data on to the AMC13 :

- Forms the connection to the PC via 10Gb ethernet
- Data send out over fibre to a PCIe card in the PC

8 ASDQs (in 4 boards):

- Pulse shaping
- Baseline restoration
- Discrimination
- Digital signal output

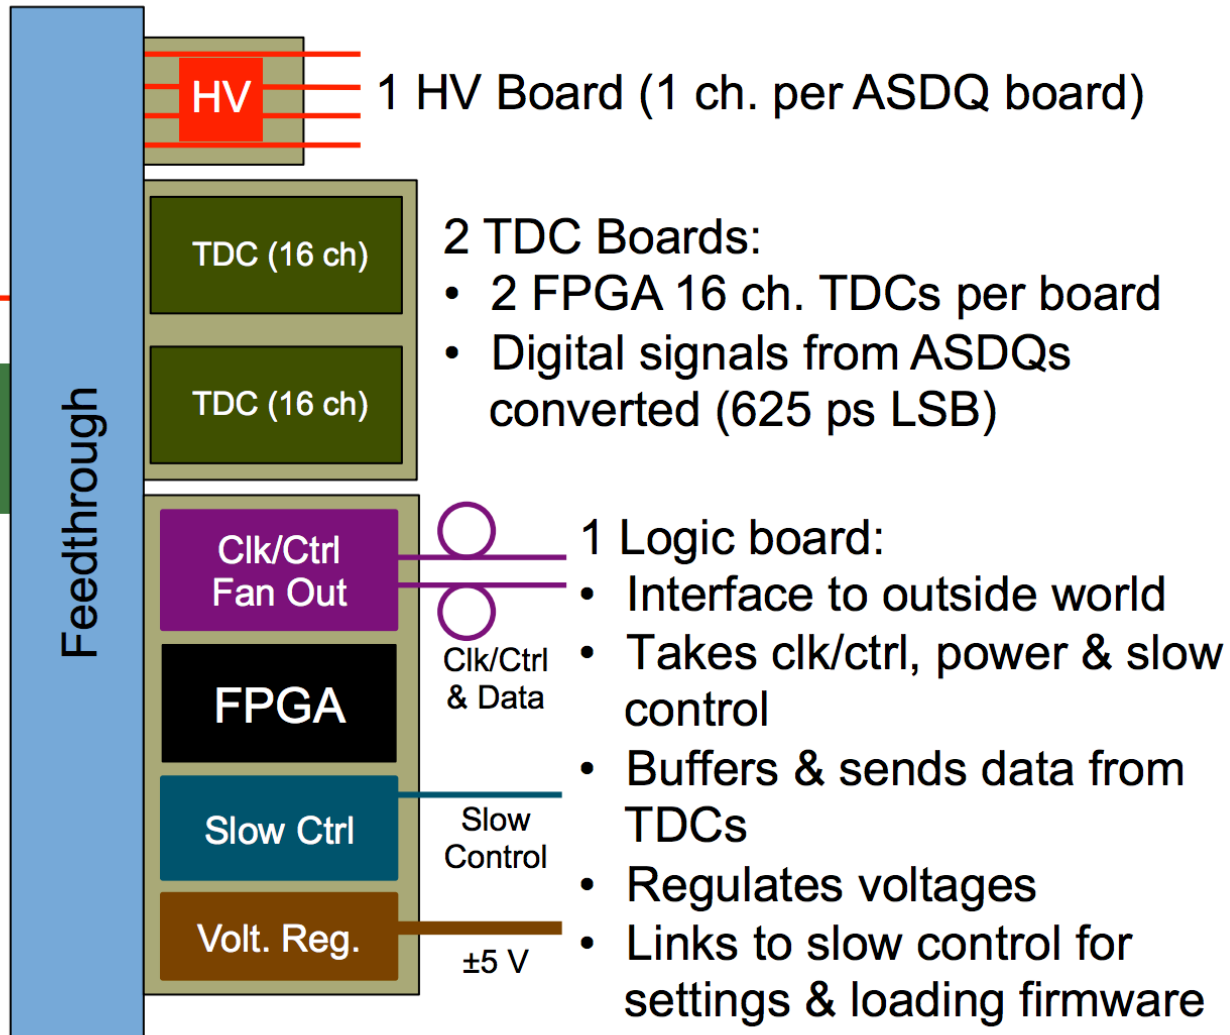

4 Flexicables:

- Power, ref. volts and signals to and from ASDQ boards

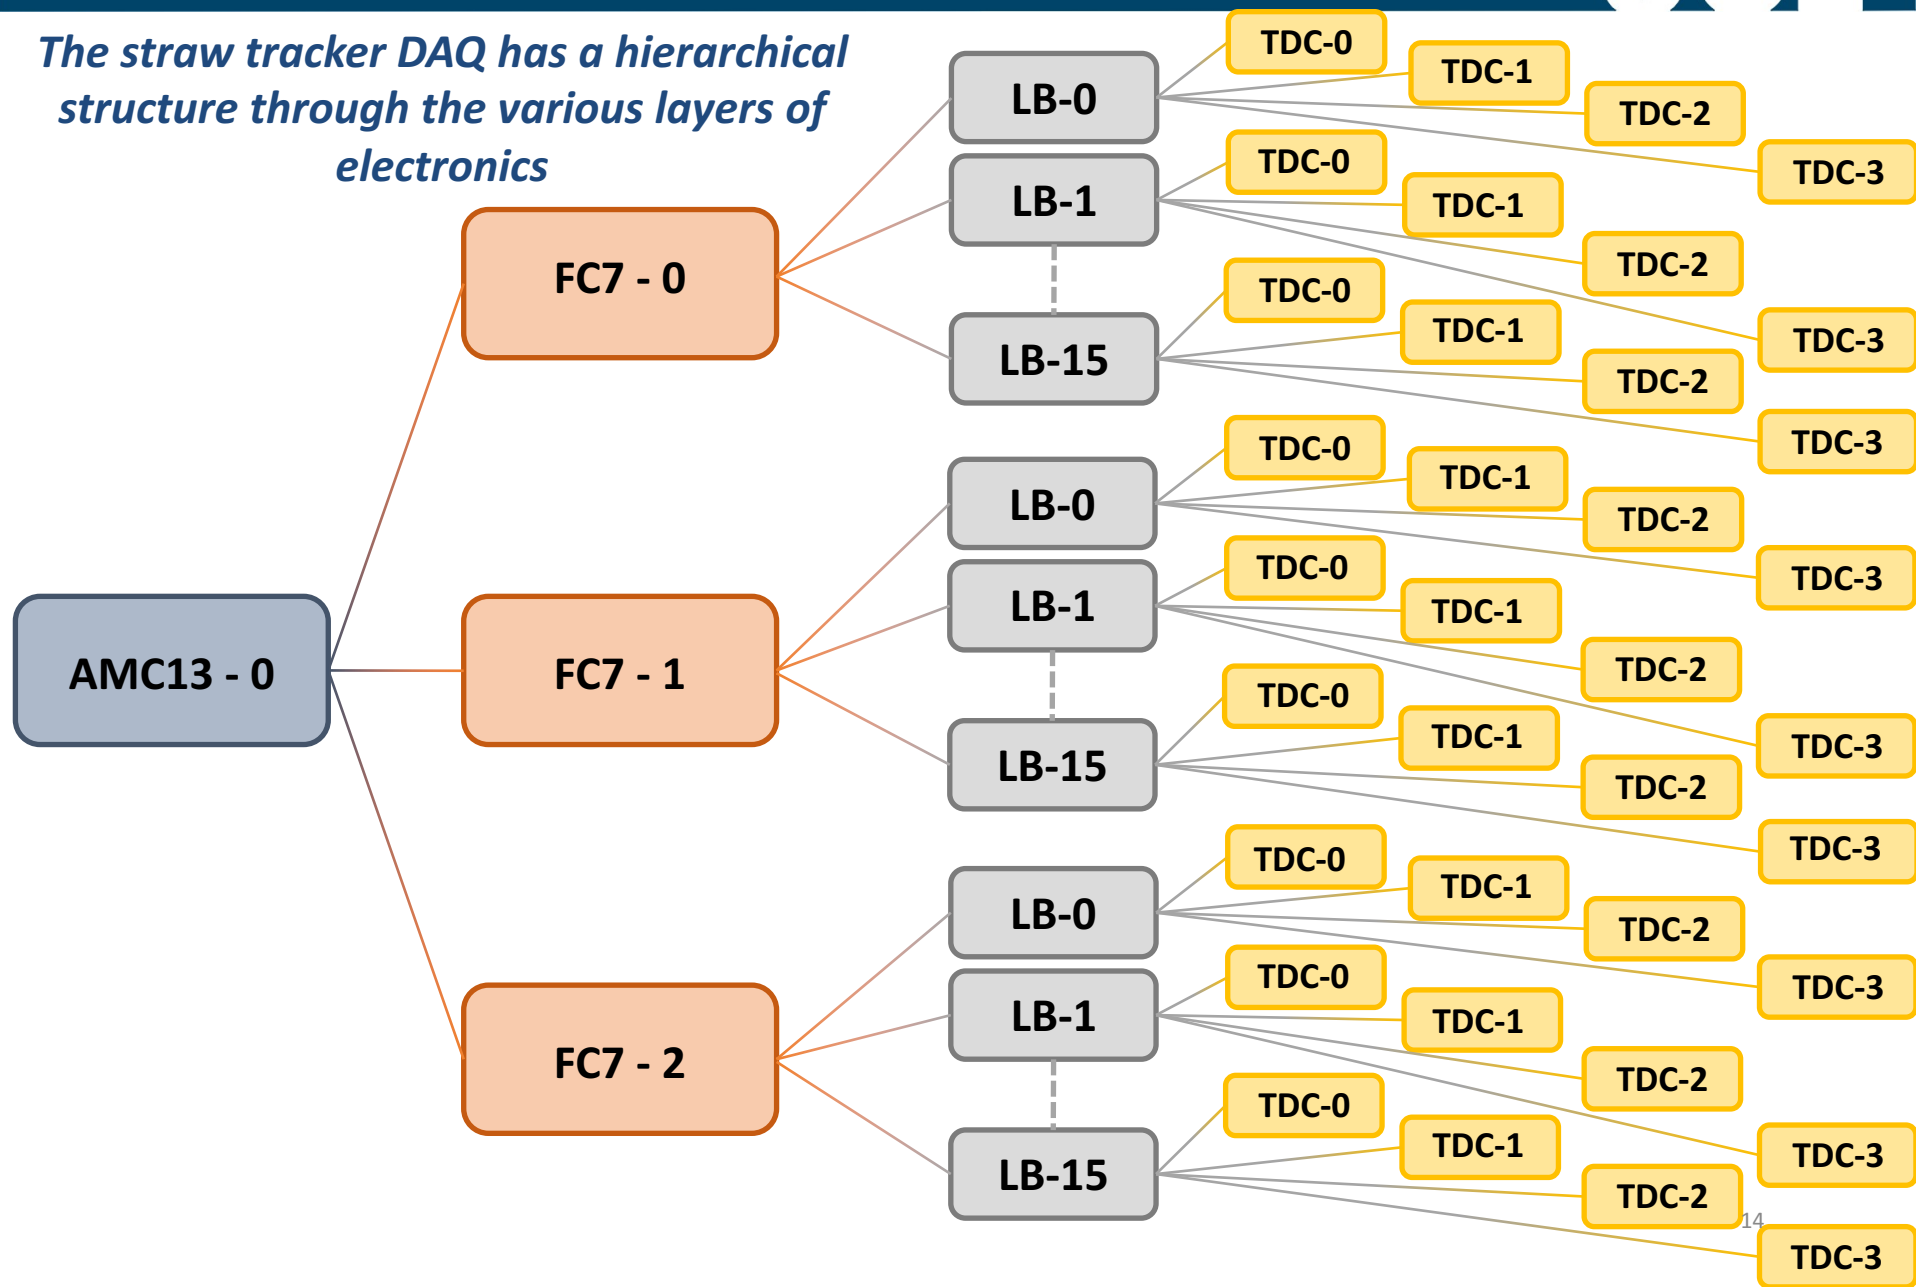

1 Feedthrough board:

- Makes gas seal
- Acts as a backplane to connect all boards

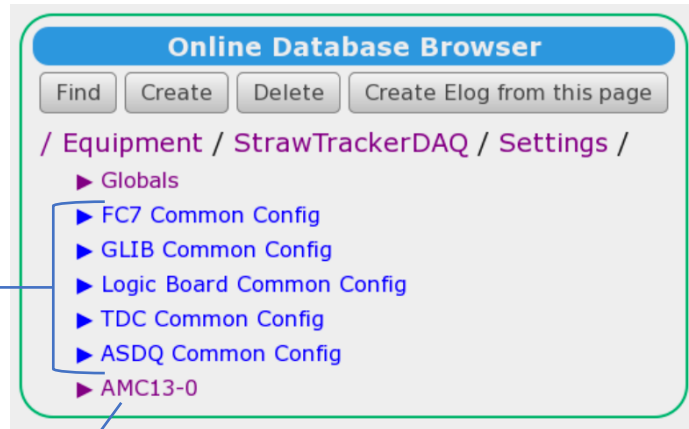

Straw Tracker DAQ Frontend

The straw tracker DAQ has a hierarchical structure through the various layers of electronics

The Online database controls the adjustable parameters for the trackers

Global settings
for each level
(applied to
every board of
that type)

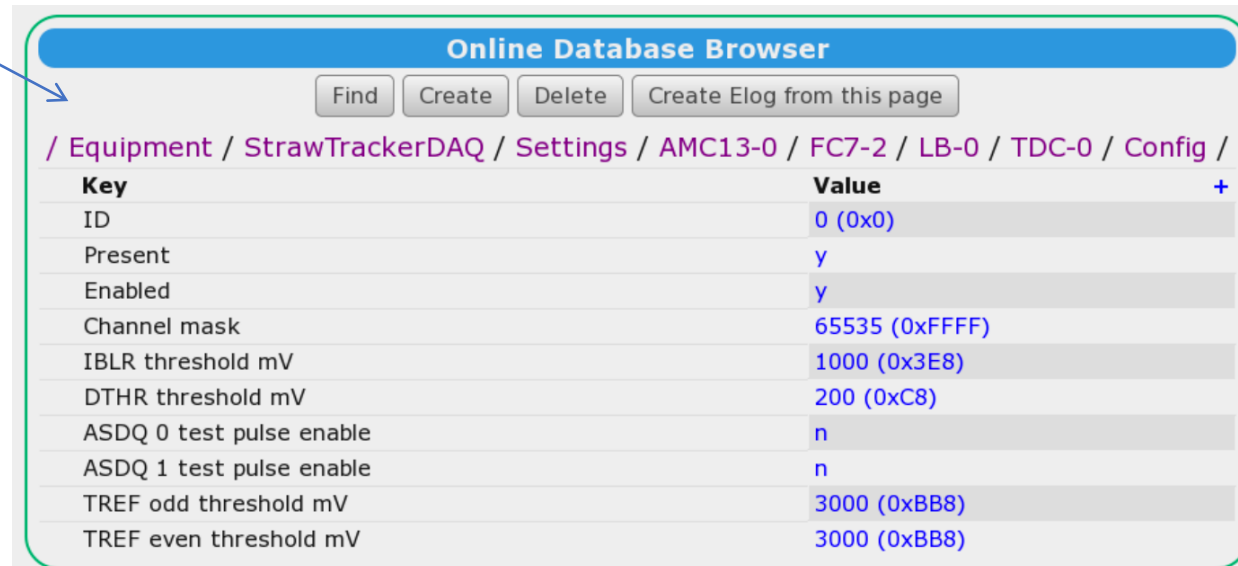

Start of the hierarchical
structure through each board

The ODB is saved at the end of
each run for reference

The parameters are programmed to
the boards when the frontend is
started

Includes any programmable parameter
in the FPGAs

The Low Voltage and Slow Controls frontend controls the USB connection to the tracker and records monitoring information – temperatures, voltages...

- The **monitoring variables** are read about once a minute (adjustable from the ODB)
 - Temperatures
 - Currents
 - Voltages
 - DAQ errors
- The values are recorded in both the **ODB** and in the **postgres database**
- The frontend is independent of the event builder
- There is a Slow Control Monitoring page to observe the variables
- Alarms in MIDAS are thrown based on these variables

Slow Controls Monitoring Page

Plots of the slow control variables read from the postgres database are displayed on a webpage : g2tracker0.fnal.gov:5000

The navigation bar on the left allows you to look at the different tracker modules

There are displays for temperatures, currents, voltages and DAQ errors

High Voltage monitoring

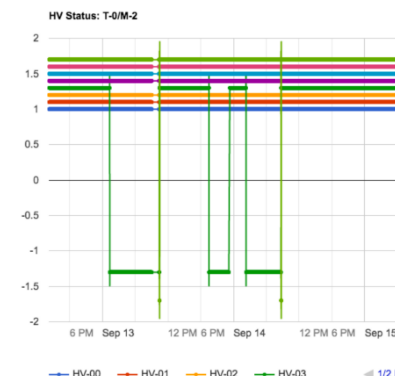

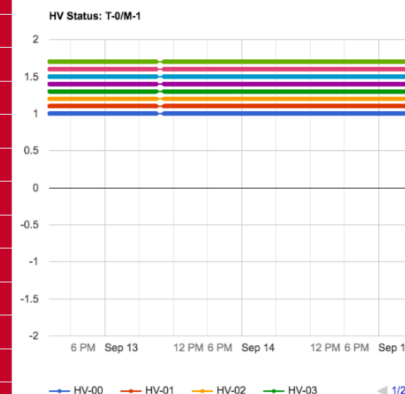

The HV monitor displays the status of the high voltage supply to the tracker modules. The HV frontend throws an alarm in the case of trips

The HV frontend also throws alarms if the HV monitor stops running

Straw Tracker-2 HV Status

Data format

The data format includes headers for each board in the hierarchy containing useful information

AMC13 HEADER

31	23	15	7	0
x"00"	Event number			
Muon trigger data write to DDR time (43 .. 32)			Word count	
"00"	ZC	Trigger type	x"00"	Muon trigger data write to DDR time (31 .. 16)
Muon trigger data write to DDR time (15 .. 0)			Board ID	

FC7 HEADER

+

31		23		15		7		0	
x"FC"			Spill number (Muon trigger count)						
Channels present					Channels enabled				
Date									
Board ID					AMC13 Events sent counter				
b"00000"		Last written DDR address (in a page)				"000"		DDR page number	
LB in event reg					"0000"		C5 Muon trigger send <u>time</u> (43 .. 32)		
C5 Muon trigger send time (31 <u>..</u> 0)									
"00"	ZC	Trigger Type		AMC 13 busy count					

This is what is put in the MIDAS data bank which is subsequently passed to the DQM / to the offline and unpacked

This is the format for the Logic boards and TDCs

With some padding for header words the data is essentially one 32 bit word per hit in the detector

Data rates

The trackers take up a tiny proportion of the total data rate from the experiment currently

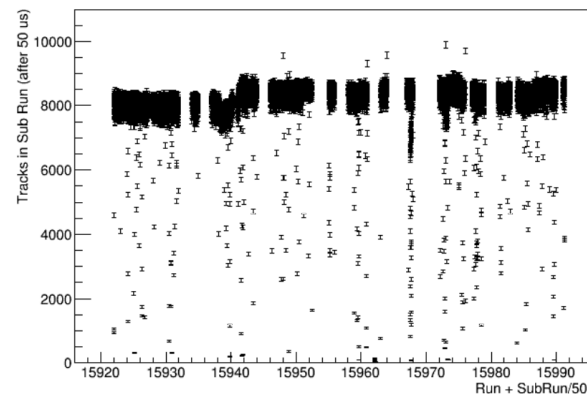

Bank	Data size per event (Mb)	Data rate (Mb/s)
Q-method	6.00	69
Laser out of fill	2.50	29
Laser crate	0.32	3.7
Kicker crate	0.53 -> 0.50	6 -> 5.75
Calo sum	1.54 -> 0.40	17.7 -> 5
T0	0.18	2
IBMS	0.39	4.4
Calo headers	0.22	2.5
GPU fits	1.00	11.5
YS	0.36 -> 0.00	4 -> 0
Straws	0.075	0.85
Total	11.585	133.7

Currently in each fill there are on average:

- ~5000 hits
- ~100 reconstructed tracks

Quality 'Y' && Quads/Kickers

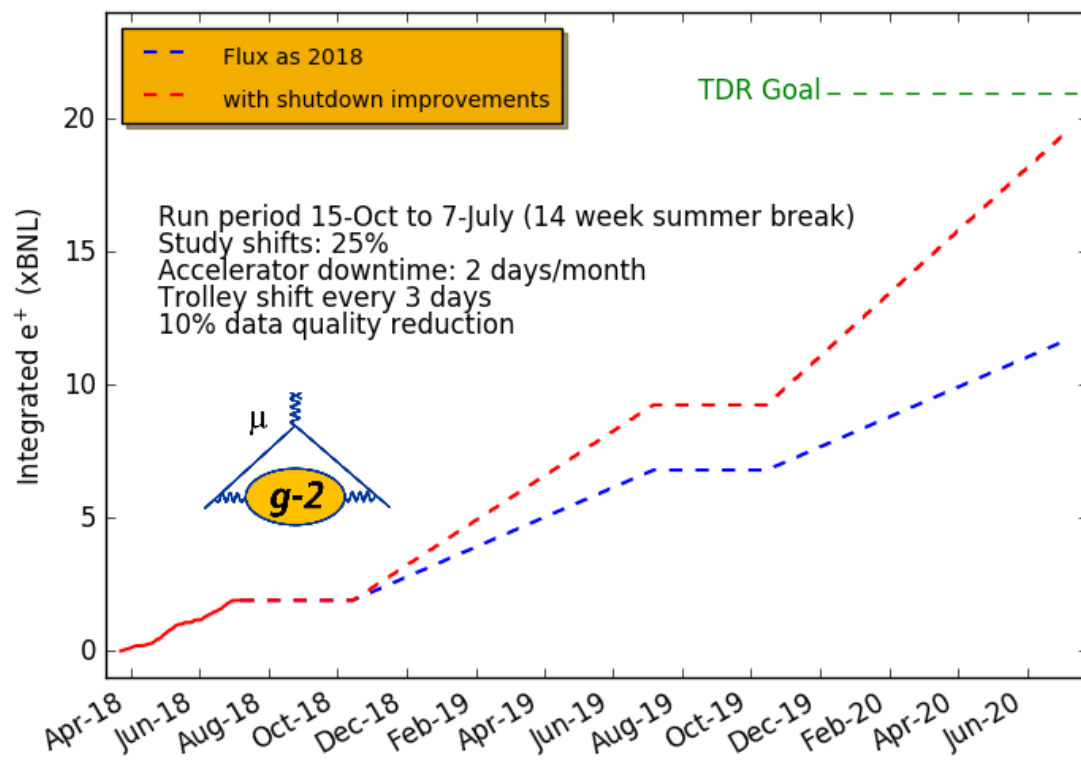

The trackers write out 0.04% of the data
we are writing currently

Over the next two years the muon storage is expected to increase by a factor of ~2

Gain	Cause
1.20	Installation of momentum-collimating wedges (cooling) in beamline
1.1-1.2	Higher kicker voltages
1.1	More reliable operation of electrostatic quads at higher voltage
1.05	Installation of 2 faster-switching PS in upstream beamline
1.5	TOTAL Product 2019
1.4	New infector
2.1	TOTAL Product 2020

A linear increase with rate would give a total for two tracking stations of about 2 Mb/s

- The current DAQ uses the MIDAS framework
- The frontends use uTCA crates with an AMC13 for the readout
- The tracker readout goes through ASDQs, TDCs, Logic boards and FC7s to the AMC13 and then on to the PC
- The current CCC system provides a 40 MHz clock with programmable triggers (based off the accelerator signal)
- The overall data rate is very low
