

Removing deprecated stuff from recob::Track

Giuseppe Cerati (FNAL)

LArSoft Coordination Meeting

Nov. 20, 2018

Introduction

- New `recob::Track` interface introduced in early 2017
- This came with the deprecation of several outdated features
- In many cases such features were maintained for backwards compatibility
 - `dQ/dx` (`fdQdx` data member, `NumberdQdx` and `DQdxAtPoint` methods)
 - `NumberFitMomentum` method
 - Various methods based on `TVector3` or `TMatrixD`
 - Old constructor
- After almost 2 years it's time to cleanup the interface from the old junk
 - indeed all those concepts are not actively used anymore
 - still they are present in a large fraction of the larsoft code
- For reference:
 - [https://cdcvcs.fnal.gov/redmine/projects/larsoft/wiki/From_ROOT_vectors_\(TVector3\)_to_ROOT_GenVector](https://cdcvcs.fnal.gov/redmine/projects/larsoft/wiki/From_ROOT_vectors_(TVector3)_to_ROOT_GenVector)

recob : : Track deletions

- One data member: `std::vector< std::vector <double> > fdQdx;`
 - when present in old files, it cannot be accessed anymore! This is actually good, it should not be accessed, **use `anab::Calorimetry` instead!**
- Two constructors, e.g:
 - `Track(std::vector<TVector3> const& xyz,
std::vector<TVector3> const& dxdydz,
std::vector<TMatrixD > const& cov,
std::vector< std::vector <double> > dQdx,
std::vector<double> fitMomentum,
int ID)`
- A few methods:
 - `size_t NumberFitMomentum()`
 - `TVector3 Vertex(), TVector3 End(), TVector3 LocationAtPoint(p)`
 - `TVector3 VertexDirection(), TVector3 EndDirection(), TVector3 DirectionAtPoint(p)`
 - `void TrajectoryAtPoint(unsigned int p, TVector3& pos, TVector3& dir)`
 - `void Extent(std::vector<double> &xyzStart, std::vector<double> &xyzEnd),`
 - `void Direction(double *dcosStart, double *dcosEnd)`
 - `size_t NumberCovariance(), TMatrixD CovarianceAtPoint(p), TMatrixD VertexCovariance(), TMatrixD EndCovariance()`
 - `size_t NumberdQdx(geo::View_t view), const double& dQdxAtPoint(unsigned int p, geo::View_t view)`
 - `void GlobalToLocalRotationAtPoint(uint p, TMatrixD& r), void LocalToGlobalRotationAtPoint(uint p, TMatrixD& r)`

recob : : Track additions

- Function names can now be used for proper return type:
 - Location methods returning `Point_t const&: Vertex(), End(), LocationAtPoint(i)`
 - Direction methods returning `Vector_t: VertexDirection(), EndDirection(), DirectionAtPoint(i)`
 - Covariance methods returning `const SMatrixSym55&: VertexCovariance(), EndCovariance()`
- Most methods now have an overloaded version templated on the return type
 - easy and clean transition for downstream code relying on `TVector3` or `TMatrixD`
 - allows usage of different types as well!
 - e.g. for position/direction/momentum: provided they can be constructed with 3 floats:

```
template<typename T> inline T Start() const {  
    auto& l = Start();  
    return T(l.X(), l.Y(), l.Z());  
}
```
- The interface is mirrored in `recob : : TrackTrajectory` and `recob : : Trajectory`

Impact of the changes

- These (breaking) changes are captured in branches named *feature/cerati_double2float_v2_breaktrack_deldepr* of the following packages:
 - lardataobj, lardata, lareventdisplay, larpandora, larreco, larana
 - ubcrt, ubana, ubcore, ubobj, ubreco, ublite
 - dunetpc
 - argoneutcode, lariatsoft, sbndcode
- The total number of files affected is 142
 - in >90% of the cases the change is trivial
 - in a few cases the change was not trivial but the functionality is the same
 - in even less cases the functionality is broken, but happens for code deprecated or unused

Trivial changes

- Just change TVector3 to auto or Point_t or Vector_t

```
larreco/Calorimetry/Calorimetry_module.cc
177 177   for(size_t trkIter = 0; trkIter < tracklist.size(); ++trkIter){
178 178
179 179       decltype(auto) larEnd = tracklist[trkIter]->Trajectory().End();
180       //store track directional cosines
181       double trackCosStart[3]={0.,0.,0.};
182       double trackCosEnd[3]={0.,0.,0.};
183       tracklist[trkIter]->Direction(trackCosStart,trackCosEnd);
184 180
185 181       // Some variables for the hit
186 182       float time;           //hit time at maximum
... ..
252 248       // find track pitch
253 249       double fTrkPitch = 0;
254 250       for (size_t itp = 0; itp < tracklist[trkIter]->NumberTrajectoryPoints(); ++itp){
255           const TVector3& pos = tracklist[trkIter]->LocationAtPoint(itp);
256           const auto& pos = tracklist[trkIter]->LocationAtPoint(itp);
257           const double Position[3] = { pos.X(), pos.Y(), pos.Z() };
258           geo::TPCID tpcid = geom->FindTPCATPosition ( Position );
259           if (tpcid.isValid) {
... ..
341 337           continue;
342 338       }
343 339       double angleToVert = geom->WireAngleToVertical(vhit[ii]->View(), vhit[ii]->WireID().TPC, vhit[ii]->WireID().Cryostat) - 0.5*::util::pi<>();
344       const TVector3& dir = tracklist[trkIter]->DirectionAtPoint(vmeta[ii]->Index());
345       const auto& dir = tracklist[trkIter]->DirectionAtPoint(vmeta[ii]->Index());
346       double cosgamma = std::abs(std::sin(angleToVert)*dir.Y() + std::cos(angleToVert)*dir.Z());
347       if (cosgamma){
348           pitch = geom->WirePitch(0)/cosgamma;
... ..
349 345       else{
350 346           pitch = 0;
351 347       }
352       TVector3 loc = tracklist[trkIter]->LocationAtPoint(vmeta[ii]->Index());
353       auto loc = tracklist[trkIter]->LocationAtPoint(vmeta[ii]->Index());
354       xyz3d[0] = loc.X();
355       xyz3d[1] = loc.Y();
356       xyz3d[2] = loc.Z();
```

Trivial changes

- Replace `TVector3::Mag()` with `Point_t::R()`

```
larana/CosmicRemoval/TrackContainment/TrackContainmentAlg.cxx
310 310     for(size_t i_p=0; i_p<geo.Nplanes(); ++i_p)
311 311         std::cout << "\t\tPlane " << i_p << " " << geo.NearestWireID(tracksVec[i_tc][i_t].End(),i_p).Wire << std::endl;
312 312         std::cout << "\tLength=" << tracksVec[i_tc][i_t].Length() << std::endl;
313 313         std::cout << "\tSimple_length=" << (tracksVec[i_tc][i_t].End()-tracksVec[i_tc][i_t].Vertex()).Mag() << std::endl;
313 313         std::cout << "\tSimple_length=" << (tracksVec[i_tc][i_t].End()-tracksVec[i_tc][i_t].Vertex()).R() << std::endl;
314 314     }//end debug statements if track contained
315 315
316 316 }//end loops over tracks
```

- Replace e.g. `TVector3` operator `[0]` with `Point_t::X()`

```
larana/OpticalDetector/TrackTimeAssocAna_module.cc
236 236
237 237
238 238     // Fill track variables
239 239     fTEnd1X = Tracks.at(0)->Vertex()[0];
240 240     fTEnd1Y = Tracks.at(0)->Vertex()[1];
241 241     fTEnd1Z = Tracks.at(0)->Vertex()[2];
242 242     fTEnd2X = Tracks.at(0)->End()[0];
243 243     fTEnd2Y = Tracks.at(0)->End()[1];
244 244     fTEnd2Z = Tracks.at(0)->End()[2];
239 239     fTEnd1X = Tracks.at(0)->Vertex().X();
240 240     fTEnd1Y = Tracks.at(0)->Vertex().Y();
241 241     fTEnd1Z = Tracks.at(0)->Vertex().Z();
242 242     fTEnd2X = Tracks.at(0)->End().X();
243 243     fTEnd2Y = Tracks.at(0)->End().Y();
244 244     fTEnd2Z = Tracks.at(0)->End().Z();
245 245
246 246     fTLength = Tracks.at(0)->Length();
247 247
```

Easy changes

- Replace e.g. `LocationAtPoint(i)` with `LocationAtPoint<TVector3>(i)`
 - this is the most typical change

```
larana/OpticalDetector/FlashHypothesisCreator.cxx
29 29  FlashHypothesisCollection fhc(geom->NOpDets());
30 30  for(size_t pt=1; pt<track.NumberTrajectoryPoints(); pt++){
31 31      if(interpolate_dEdx)
32      fhc = fhc + CreateFlashHypothesesFromSegment(track.LocationAtPoint(pt-1),
33                                                  track.LocationAtPoint(pt),
34                                                  0.5*(dEdxVector[pt]+dEdxVector[pt-1]),
35                                                  providers,pvs,opdigip,Xoffset);
36 36      else
37      fhc = fhc + CreateFlashHypothesesFromSegment(track.LocationAtPoint<TVector3>(pt-1),
38                                                  track.LocationAtPoint<TVector3>(pt),
39                                                  dEdxVector[pt-1],
40                                                  providers,pvs,opdigip,Xoffset);
41 41  }
```

Code duplication

- In way too many places `recob::Track::Length()` was re-implemented locally.
- The central version changed with the new `recob::Track` (supporting the case of invalid hits), so these local version are now potentially buggy and were changed to return the central version

```
dune/TrackFinderDUNE/TrackAnaCT_module.cc
121 121 //-----
122 122 double length(const recob::Track& track)
123 123 {
124     double result = 0.;
125     TVector3 disp = track.LocationAtPoint(0);
126     int n = track.NumberTrajectoryPoints();
127
128     for(int i = 1; i < n; ++i) {
129         const TVector3& pos = track.LocationAtPoint(i);
130         disp -= pos;
131         result += disp.Mag();
132         disp = pos;
133     }
134     // mf::LogVerbatim("output") << " length (track) " << result;
135     return result;
124 124 return track.Length();
136 125 }
137 126
138 127 // Length of MC particle.
```

Usage of Extent and Direction

- In the old interface the usage of `Extent` and `Direction` was inconsistent, with one taking an array and the other a vector of double.
- Moving to a templated version and choosing a `TVector3` return type is transparent wrt the rest of the code (`TVector3` supports `operator[]`)

```
ubana/TPCNeutrinoIDFilter/Algorithms/NuMuCCSelectionIIAlgMCC7.cxx
160 160     std::vector<double> trkenddcosy(tracklist.size());
161 161     std::vector<double> trkenddcosz(tracklist.size());
162 162     std::vector<double> trklen(tracklist.size());
163     double larStart[3];
164     double larEnd[3];
165     std::vector<double> trackStart;
166     std::vector<double> trackEnd;
163     TVector3 larStart;
164     TVector3 larEnd;
165     TVector3 trackStart;
166     TVector3 trackEnd;
167 167     for (size_t i = 0; i<tracklist.size(); ++i){
168         trackStart.clear();
169         trackEnd.clear();
170         for(int j=0; j<3; ++j) {
171             larStart[j] = 0.;
172             larEnd[j] = 0.;
173         }
174         tracklist[i]->Extent(); //trackStart,trackEnd);
175         tracklist[i]->Direction(larStart,larEnd);
168         std::tie(trackStart,trackEnd) = tracklist[i]->Extent<TVector3>();
169         std::tie(larStart,larEnd) = tracklist[i]->Direction<TVector3>();
176 170         trkstartx[i]     = trackStart[0];
177 171         trkstarty[i]     = trackStart[1];
178 172         trkstartz[i]     = trackStart[2];
```

Templating `pma::Dist2`

- Lots of code uses `pma::Dist2(TVector3, TVector3)`
- Another version already exists, using `Vector3D`
- Replacing with a templated version (on both arguments) makes it support also `Point_t` and make the transition straightforward
 - the template arguments are automatically deduced, so no change in downstream code!

```
larreco/RecoAlg/PMAlg/Utilities.h
42 42     double Dist2(const TVector2 & v1, const TVector2 & v2);
43 43     double Dist2(const Vector2D & v1, const Vector2D & v2);
44 44
45 45     double Dist2(const TVector3 & v1, const TVector3 & v2);
46 46     double Dist2(const Vector3D & v1, const Vector3D & v2);
47 47     template <typename T, typename U> double Dist2(const T & v1, const U & v2) {
48 48         double dx = v1.X() - v2.X(), dy = v1.Y() - v2.Y(), dz = v1.Z() - v2.Z();
49 49         return dx * dx + dy * dy + dz * dz;
50 50     }
51 51
52 52     size_t GetHitsCount(const std::vector< pma::Hit3D* >& hits, unsigned int view);
53 53     double GetSummedADC(const std::vector< pma::Hit3D* >& hits, unsigned int view = geo::kUnknown);
```

Other non trivial cases

- As a general rule, no interface is changed in the downstream code. Exceptions are a couple of cases with functions used only locally:
 - ubreco/ShowerReco/ProximityClustering/CosmicFilter_module.cc:
 - `SqDist(const Point_t& pt)`
 - ubcrt/CRT/CRTeffStd_module.cc:
 - `SortTrackPoints(const recob::Track& tk, vector<Point_t>& sorted_trk)`
- In a few cases a `TVector3` was constructed from the old vertex interface
 - now moved to `Point_t`

```
ubana/TPCNeutrinoIDFilter/Algorithms/ChargedTrackMultiplicityAlg.cxx
197 197     art::Ptr<recob::Vertex> vertex(vertexVecHandle, vertexIdx);
198 198
199 199     // Get the position of the vertex
200     // Ultimately we really want the vertex position in a TVector3 object...
201     double vertexXYZ[3];
202
203     vertex->XYZ(vertexXYZ);
204
205     TVector3 vertexPos(vertexXYZ[0],vertexXYZ[1],vertexXYZ[2]);
200     auto vertexPos = vertex->position();
206 201
207 202     if(inFV(vertexPos.X(),vertexPos.Y(),vertexPos.Z()))
208 203     {
```

Deprecating the old constructor: relatively easy changes

- Replace old constructor (with dummy dQdx, momentum, covariance) with new constructor (after converting vectors to proper type)

```
larreco/TrackFinder/CCTrackMaker_module.cc
447 447 // are possibly broken clusters but we will consider these when matching between planes
448 448 fMergeErrorCut = 10;
449 449
450 // some junk vectors to satisfy the recob::Track constructor
451 std::vector< std::vector<double> > dQdx;
452 std::vector<double> mom(2, util::kBogusD);
453 // prepare a bogus covariance matrix so that the TrackAna module doesn't bomb
454 TMatrixD cov(5,5);
455 for(unsigned short ii = 0; ii < 5; ++ii) cov(ii, ii) = 1;
456 std::vector<TMatrixD> tmpCov;
457 tmpCov.push_back(cov);
458 tmpCov.push_back(cov);
459 450 std::vector< art::Ptr<recob::Hit > > tmpHits;
460 451 std::vector< art::Ptr<recob::Cluster > > tmpCls;
461 452 std::vector< art::Ptr<recob::Vertex > > tmpVtx;
...
694 685 // track
695 686 // make the track
696 687 size_t tStart = tcol->size();
697 recob::Track track(trk[tIndex].TrjPos, trk[tIndex].TrjDir, tmpCov, dQdx, mom, tID);
688 recob::Track track(recob::TrackTrajectory(recob::tracking::convertCollToPoint(trk[tIndex].TrjPos),
689 recob::tracking::convertCollToVector(trk[tIndex].TrjDir),
690 recob::Track::Flags_t(trk[itr].TrjPos.size()), false),
691 0, -1., 0, recob::tracking::SMatrixSym55(), recob::tracking::SMatrixSym55(), tID);
698 692 tcol->emplace_back(std::move(track));
699 693 size_t tEnd = tcol->size();
700 694 // PFParticle - track association
...
740 734 for(unsigned short itr = 0; itr < trk.size(); ++itr) {
741 735 // ignore already saved tracks
742 736 if(trk[itr].ID < 0) continue;
743 recob::Track track(trk[itr].TrjPos, trk[itr].TrjDir, tmpCov, dQdx, mom, trk[itr].ID);
737 recob::Track track(recob::TrackTrajectory(recob::tracking::convertCollToPoint(trk[itr].TrjPos),
738 recob::tracking::convertCollToVector(trk[itr].TrjDir),
739 recob::Track::Flags_t(trk[itr].TrjPos.size()), false),
740 0, -1., 0, recob::tracking::SMatrixSym55(), recob::tracking::SMatrixSym55(), trk[itr].ID);
744 741 tcol->emplace_back(std::move(track));
745 742 tmpHits.clear();
746 743 for(ipl = 0; ipl < nplanes; ++ipl)
```

Deprecating the old constructor: complicated cases

- In these cases the functionality of the code is changing (not dramatically, but noticeably).
- I believe they are not actively being used by any experiment.

- `larreco/RecoAlg/StitchAlg.cxx`
 - Merges tracks.
 - Removed `dQdx`, added flags, adapted usage of momentum and covariance
 - the new track will have `fHasMomentum` set to true only if true for all input tracks

- `larreco/TrackFinder/TrackCheater_module.cc`
 - Fills a `recob::Track` from simulation information.
 - Removed `dQdx` and momentum magnitudes, fill momentum vector instead of direction

- `larreco/TrackFinder/Track3DKalmanSPS_module.cc`
 - creates tracks from `recob::SpacePoints`, also produces a validation `TTree`
 - removed `dQdx` and momentum magnitudes from produced `recob::Track` (but it is still in `TTree`), fill momentum vector instead of direction

Removing NumberdQdx and DQdxAtPoint

- In these cases the functionality of the code is changing, in a couple of cases significantly.
- However, I believe they are just analyzers and/or not actively being used by any experiment.
- For now, where a functionality is 'broken', a big WARNING is added:
 - should we throw an exception instead? should we deprecate or delete the code?
- `lardata/ArtDataHelper/Dumpers/DumpTracks_module.cc`
 - not dumping dQdx information anymore.
- `larpandora/LArPandoraAnalysis/PFParticleTrackAna_module.cc`
 - commented out parts where calorimetry information of the output `TTree` are filled, added warning.
- `ubana/TPCNeutrinoIDFilter/Algorithms/NuMuCCSelectionIIAlg.cxx`
 - track dQdx accessed only if calibrated calorimetry not available (should not be used anyways!). Commented out, added warning.
- `larreco/Calorimetry/GeneralCalorimetry_module.cc`
 - module relies on track dQdx (commented out entire produce method, added warning). **Only file now completely unfunctional.**
- `larreco/DirOfGamma/MergeEMShower3D_module.cc`
 - code where tracks are merged into showers (author now left the field). Commented out specific part, added warning.
- `dunetpc/dune/FDSensOpt/IniSegReco_module.cc`
 - track dQdx info accessed inside an if which is probably never true. Commented out specific part, added warning.

```
/*
*****
/*                               WARNING                               */
*****
/* The dQdx information in recob::Track has been deprecated */
/* since 2016 and in 11/2018 the recob::Track interface was */
/* changed and DQdxAtPoint and NumberdQdx were removed.    */
/* Therefore the code below is now commented out           */
/* (note that it was most likely not functional anyways).   */
/* For any issue please contact: larsoft-team@fnal.gov      */
*****
*/
```

Next steps

- Agree on deprecation strategy
- Still unresolved tension between “fitted” (i.e. with covariance matrices and chi2) and “unfitted” tracks
 - original plan was that “unfitted” use `recob::TrackTrajectory` while “fitted” use `recob::Track`.
 - it’s now easier since the interface is mirrored, but it may not be easy to digest for experiments
 - an alternative could be to rename `recob::TrackTrajectory` as `recob::Track`, and `recob::Track` as something like `recob::FittedTrack`
 - this will be more transparent since most people currently use ‘unfitted’ `recob::Tracks`
 - or the simplest solution would be to add a bool that says if the track was “fitted” or not
 - kind of giving up on the original plan of different products, but definitely very easy to achieve

Conclusions

- Cleaned up `recob::Track` interface, finally
- As a result we have:
 - more efficient, more flexible, and cleaner code
 - removed dangerous code duplication
 - identified deprecated code
- All larsoft and experiment code has been fixed, but private user code may be broken with these changes
 - this presentation should cover most or all cases, please forward to anybody having issues
 - or just get in touch with the larsoft team
- Still some items on the to do list
 - we should find an way to complete them without too much hassle
