

protoDUNE e- lifetime analysis

Lisa Lin and Tianle Liu
University of Chicago

Before we begin, a big thanks to...

Ajib Paudel and Tingjun Yang!!

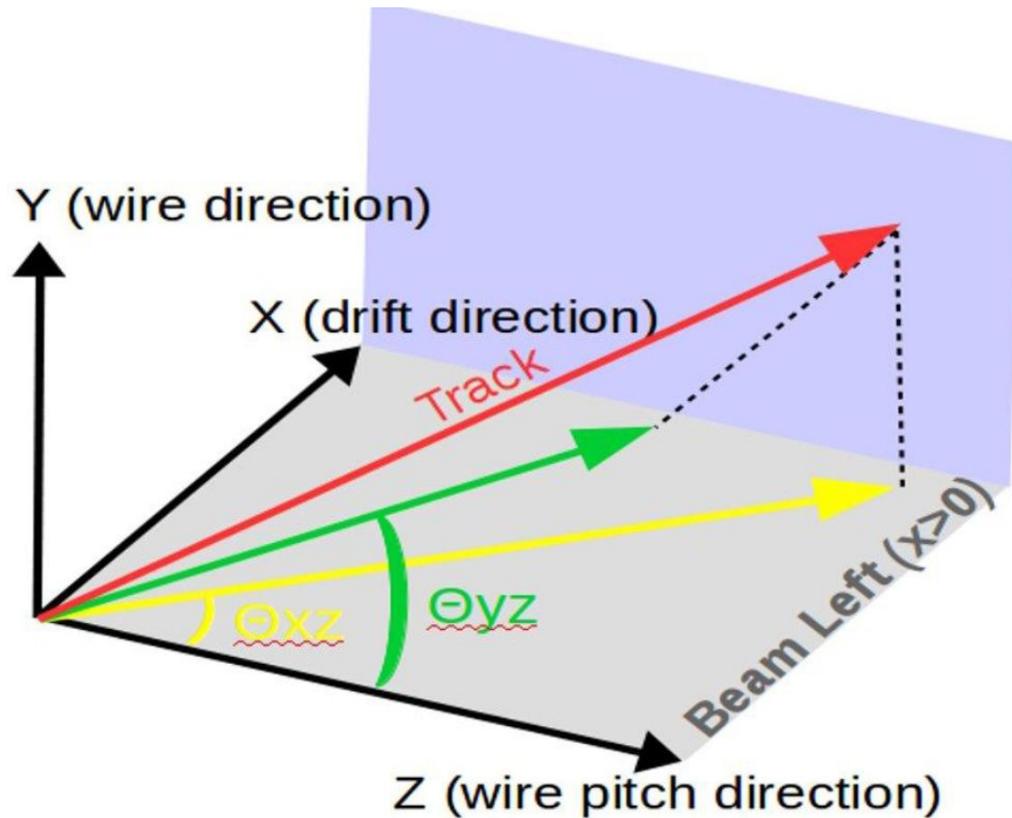

Objective

- Study protoDUNE's purity over time; impurities (e.g. O_2 , H_2O) in LAr result in lower reconstructed dQ/dx values as hit distance from APAs increases

Procedure

- Only accept through-going, t_0 -tagged cosmic rays
- Sort hit dQ/dx values into bins based on x-position
- Take median dQ/dx of each bin
- Graph and fit with exponential $f(x)=\exp(p_0+p_1*x)$ to get in form of $dQ/dx = (dQ/dx)_0 * \exp(-x/v_d * \tau)$
 - v_d = drift velocity = 0.16 cm/ μ s, τ = electron lifetime
- $\tau = 1/[v_d * p_1]$

Angular cuts

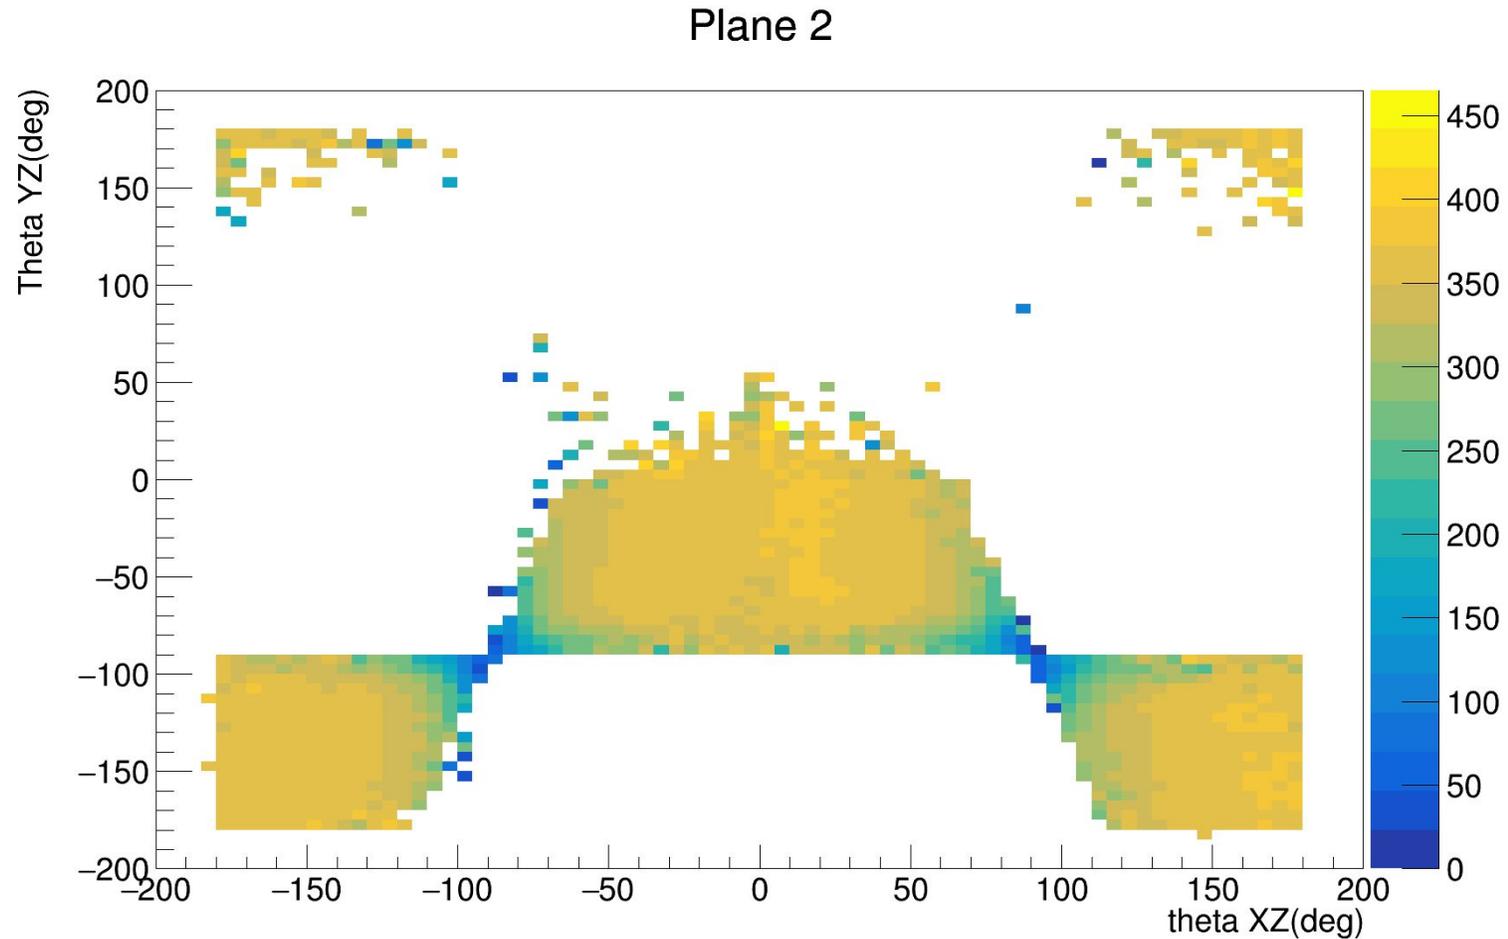

- Θ_{XZ} : the angle between the projection of the track on the XZ plane and the z-axis
- Θ_{YZ} : the angle between the projection of the track on the YZ plane and the z-axis

Angular cuts

- Tracks parallel and perpendicular to the wire planes are not well-reconstructed, so we want to remove these from our analysis
- We can single out these tracks using plots of the track projection angles on the XZ and YZ planes

Angular cuts

- Plot shows avg dQ/dx as a function of θ_{XZ} and θ_{YZ}
- All of these plots look pretty similar, so use same cut for all (MC + reco)

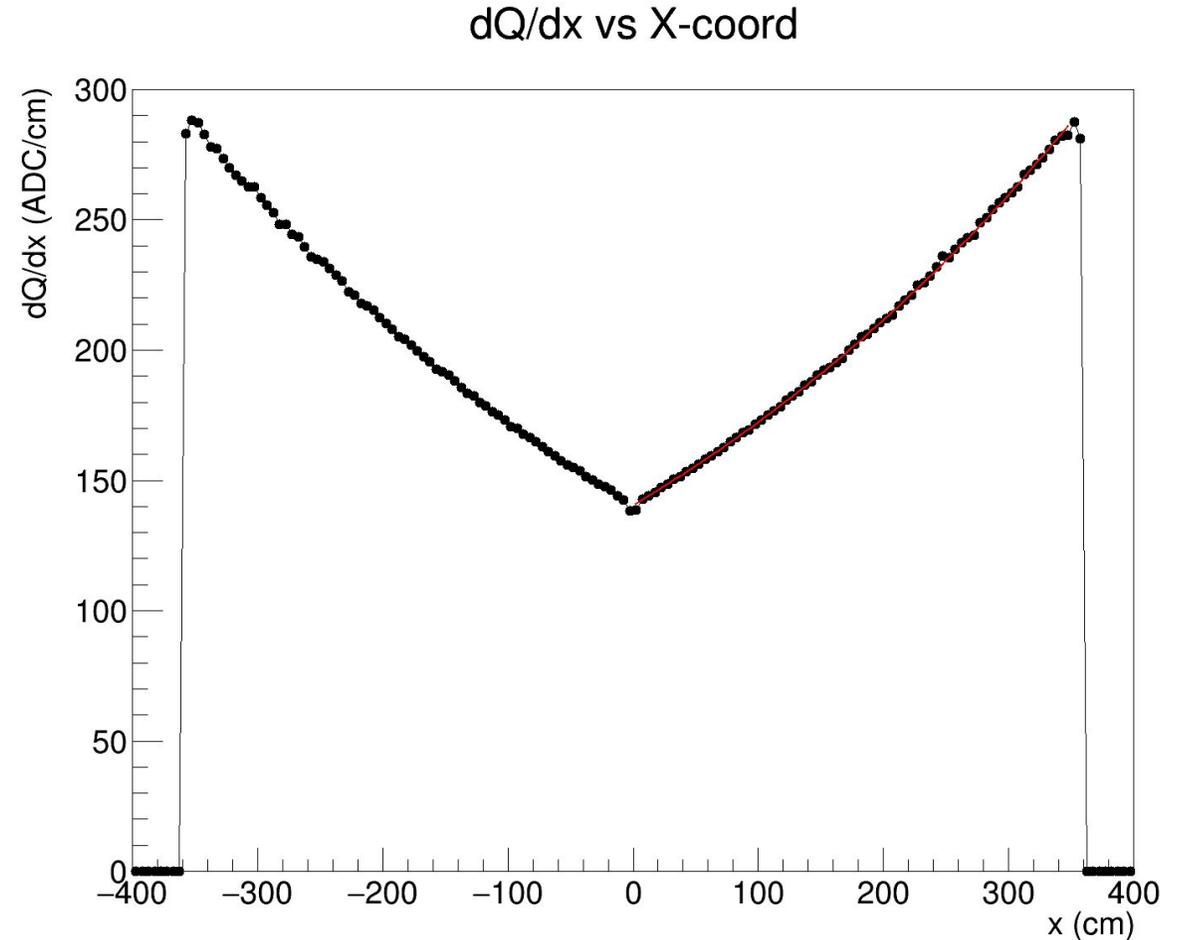

Monte Carlo simulations – no SCE

e- lifetime for $x < 0$: 3060.51 μs

e- lifetime for $x > 0$: 3054.98 μs

avg e- lifetime: 3057.75 μs

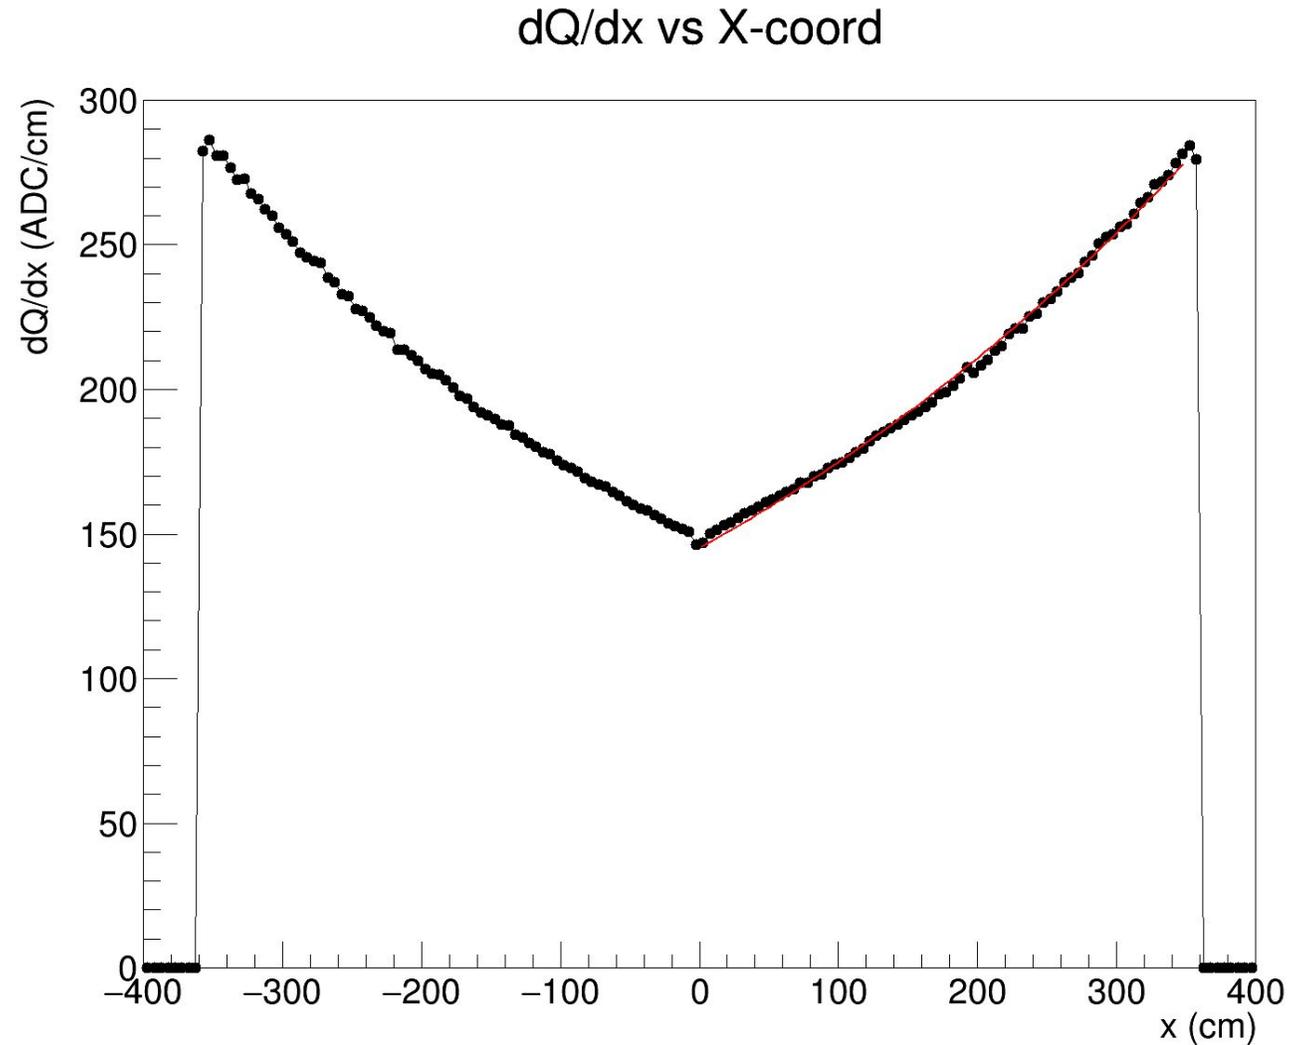

SCE

e- lifetime for $x < 0$: 3322.25 μs

e- lifetime for $x > 0$: 3345.06 μs

avg e- lifetime: 3333.66 μs

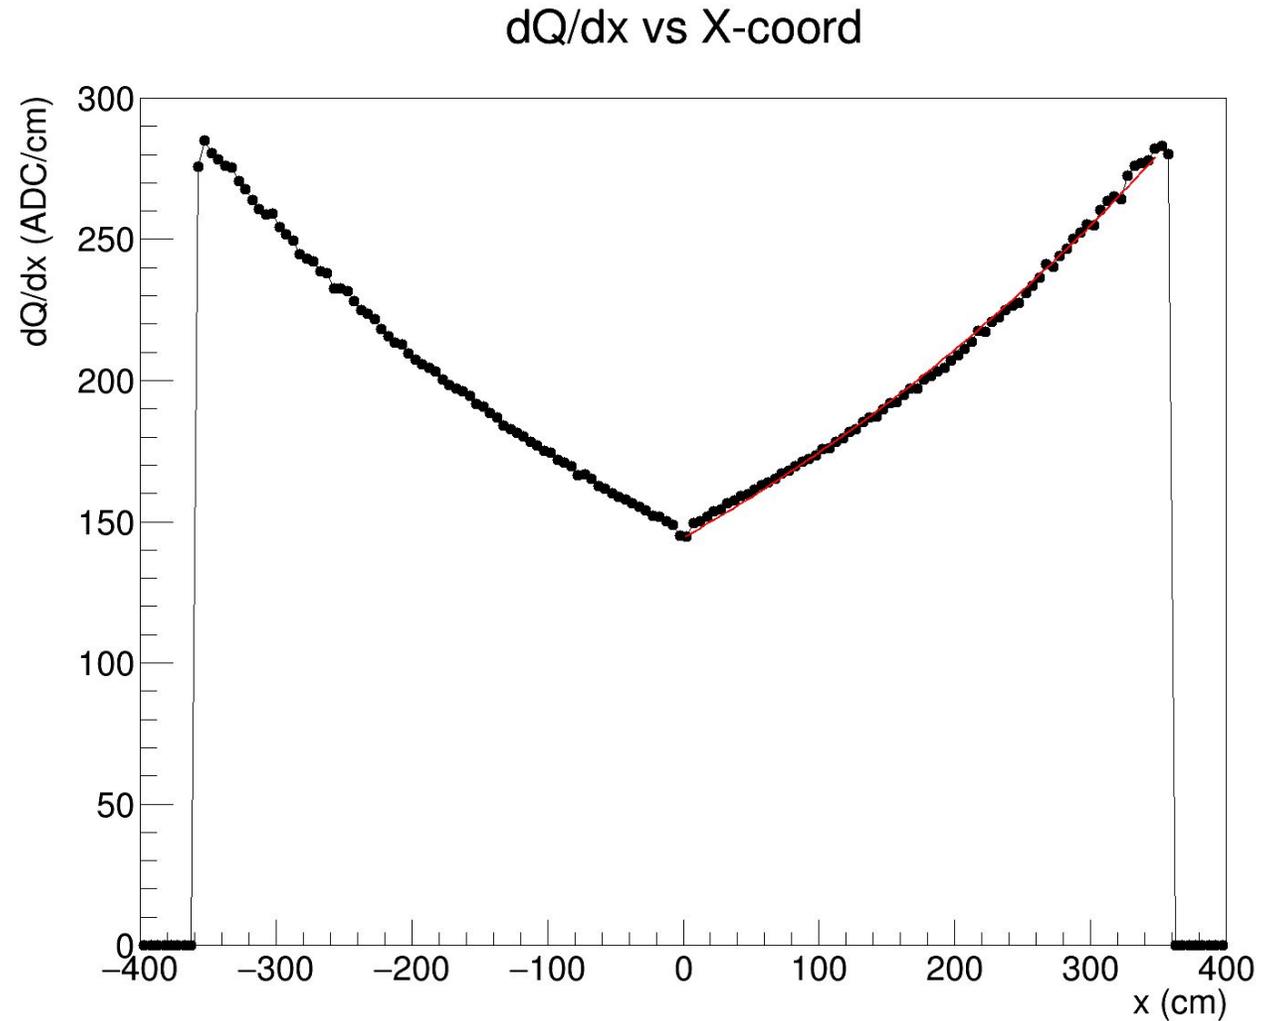

FLF

e- lifetime for $x < 0$: 3293.57 μs

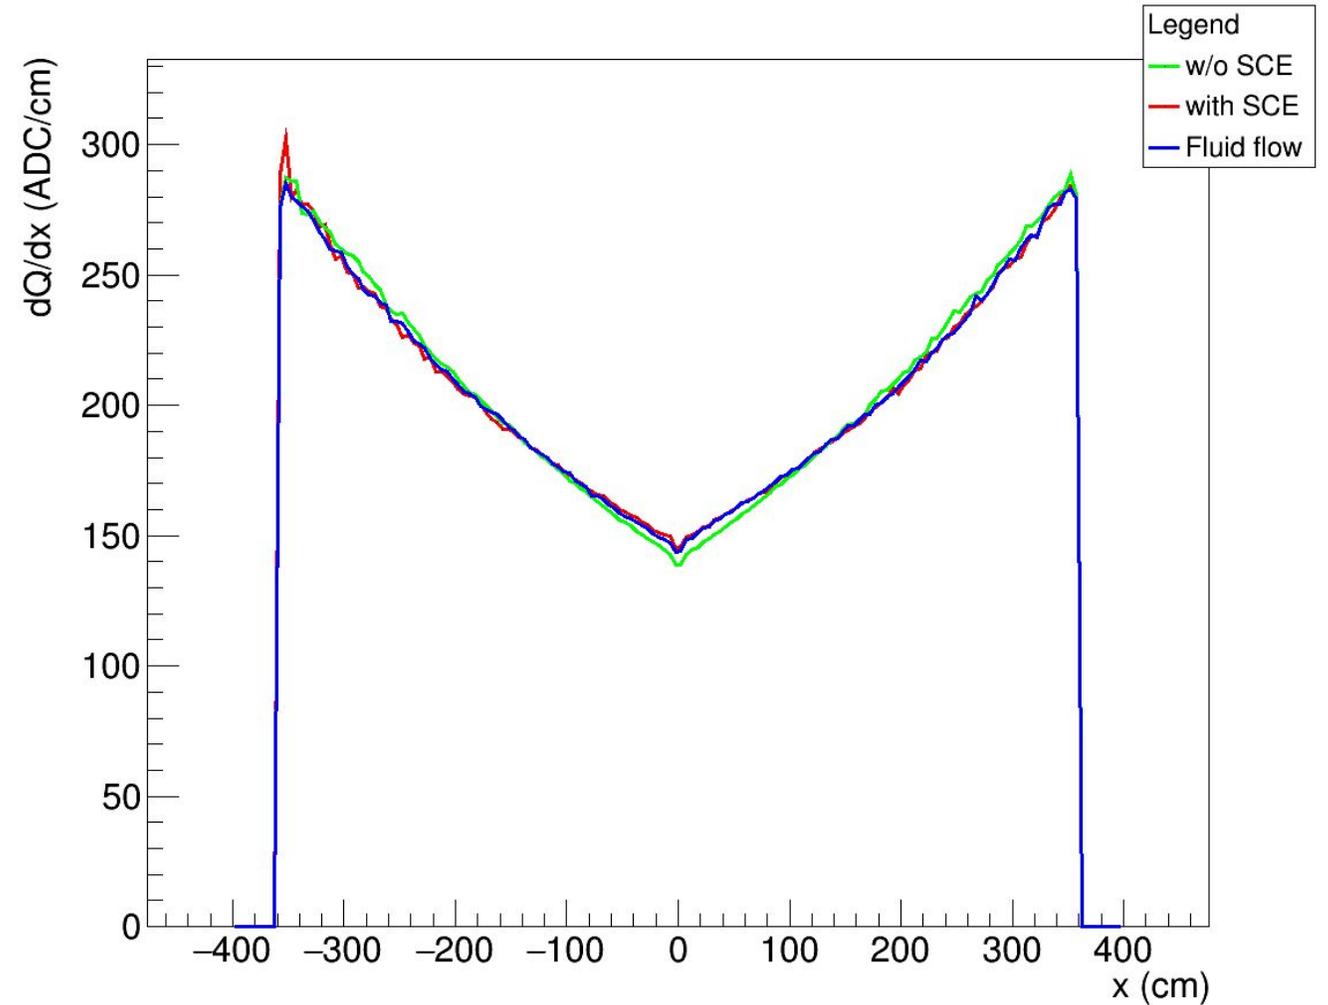

e- lifetime for $x > 0$: 3299 μs

avg e- lifetime: 3296.29 μs

Space charge effect

- MC data is shown
- Angular cuts applied

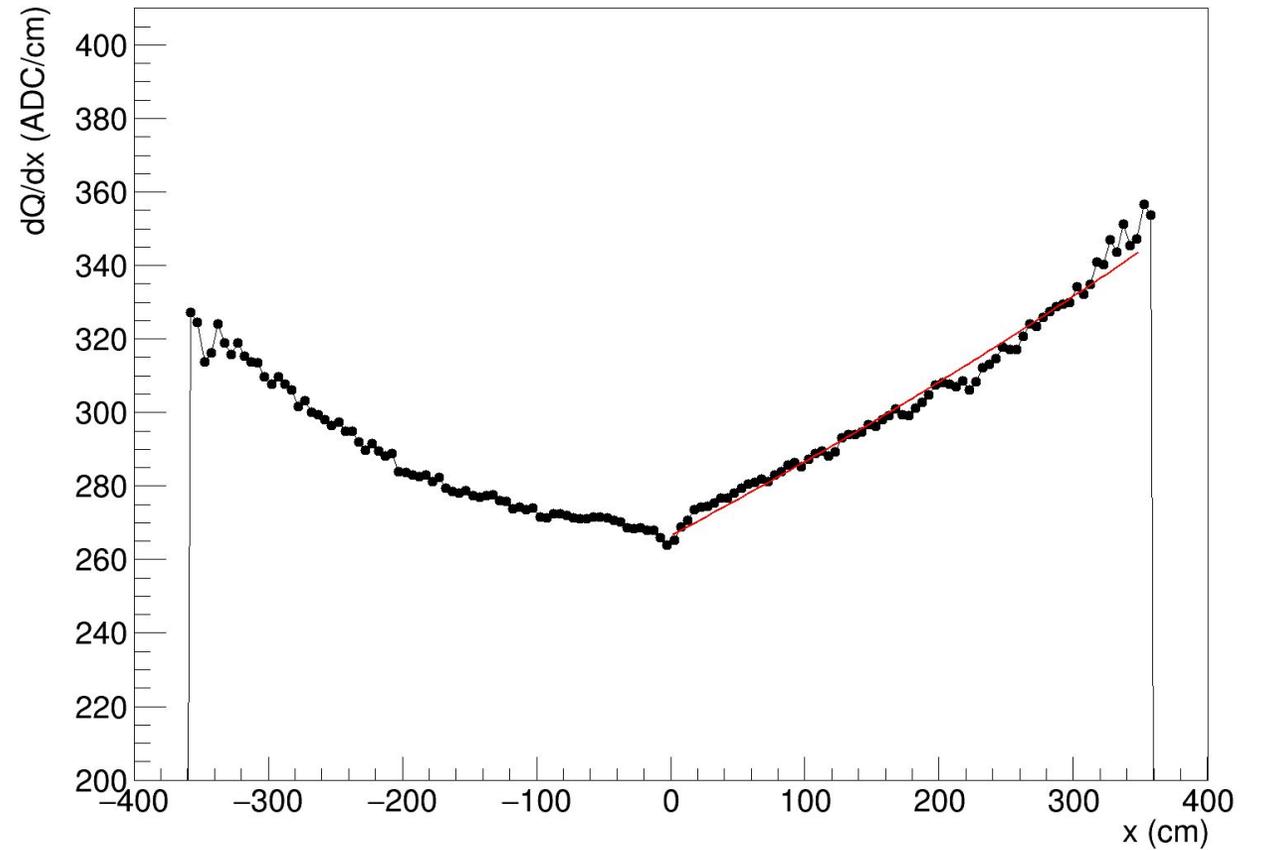

Run 5141

e- lifetime for $x < 0$: 11222.4 μs

e- lifetime for $x > 0$: 8572.03 μs

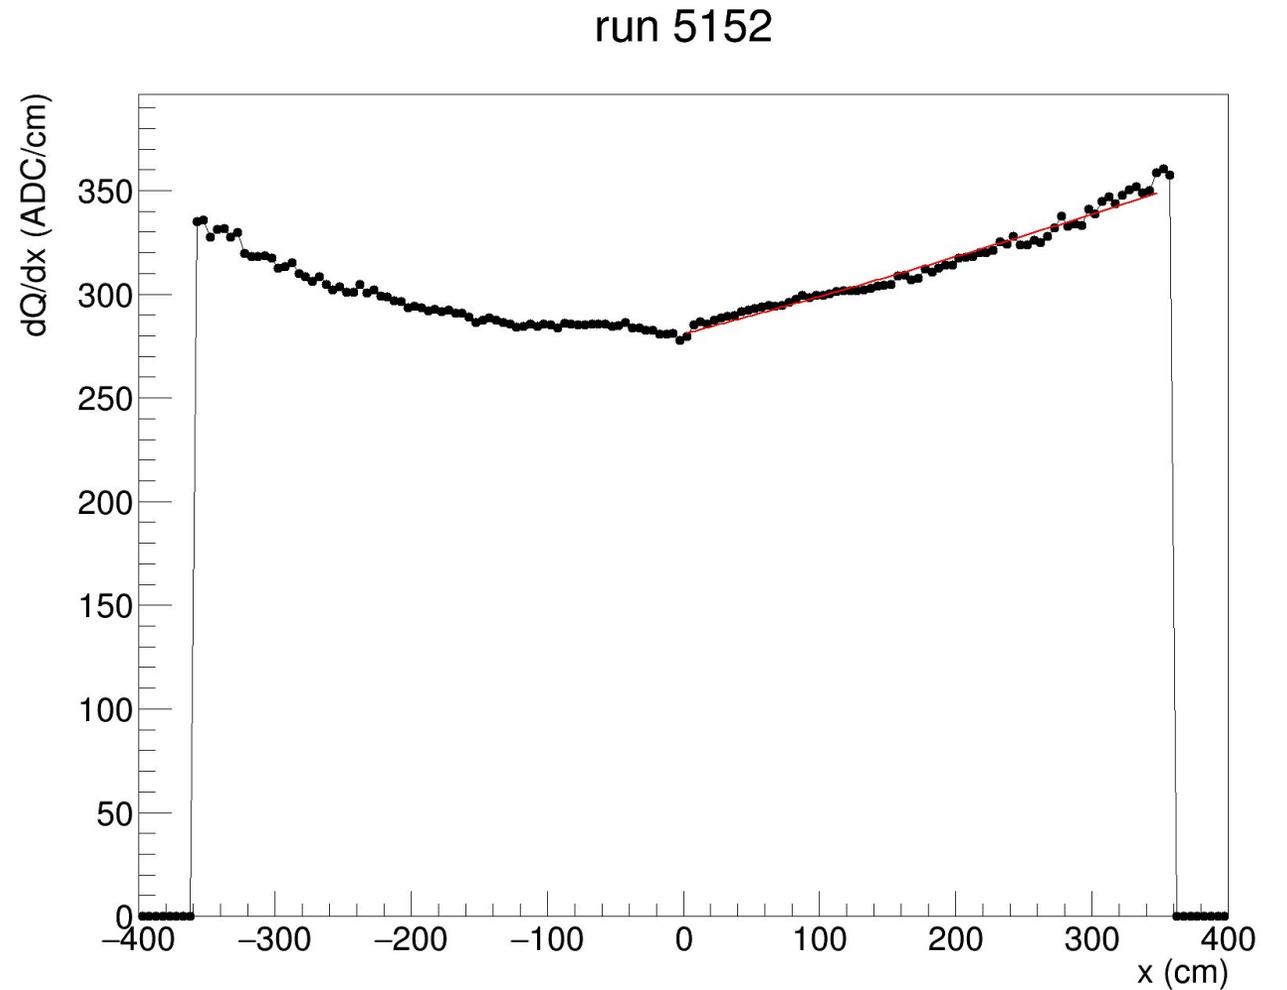

dQ/dx vs X-coord

Run 5152

e- lifetime for $x < 0$: 13821.3 μs

e- lifetime for $x > 0$: 10016.7 μs

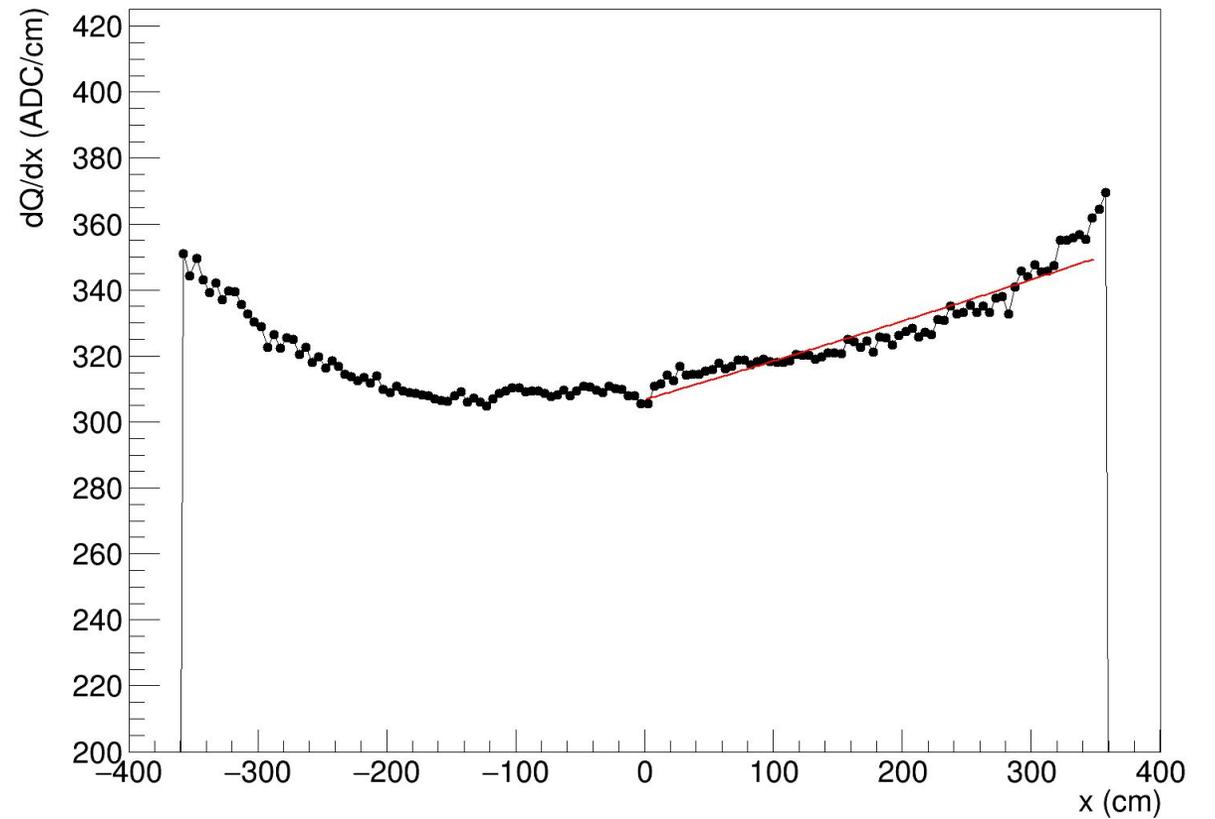

Run 5225

e- lifetime for $x < 0$: 21782.4 μs

e- lifetime for $x > 0$: 16745.2 μs

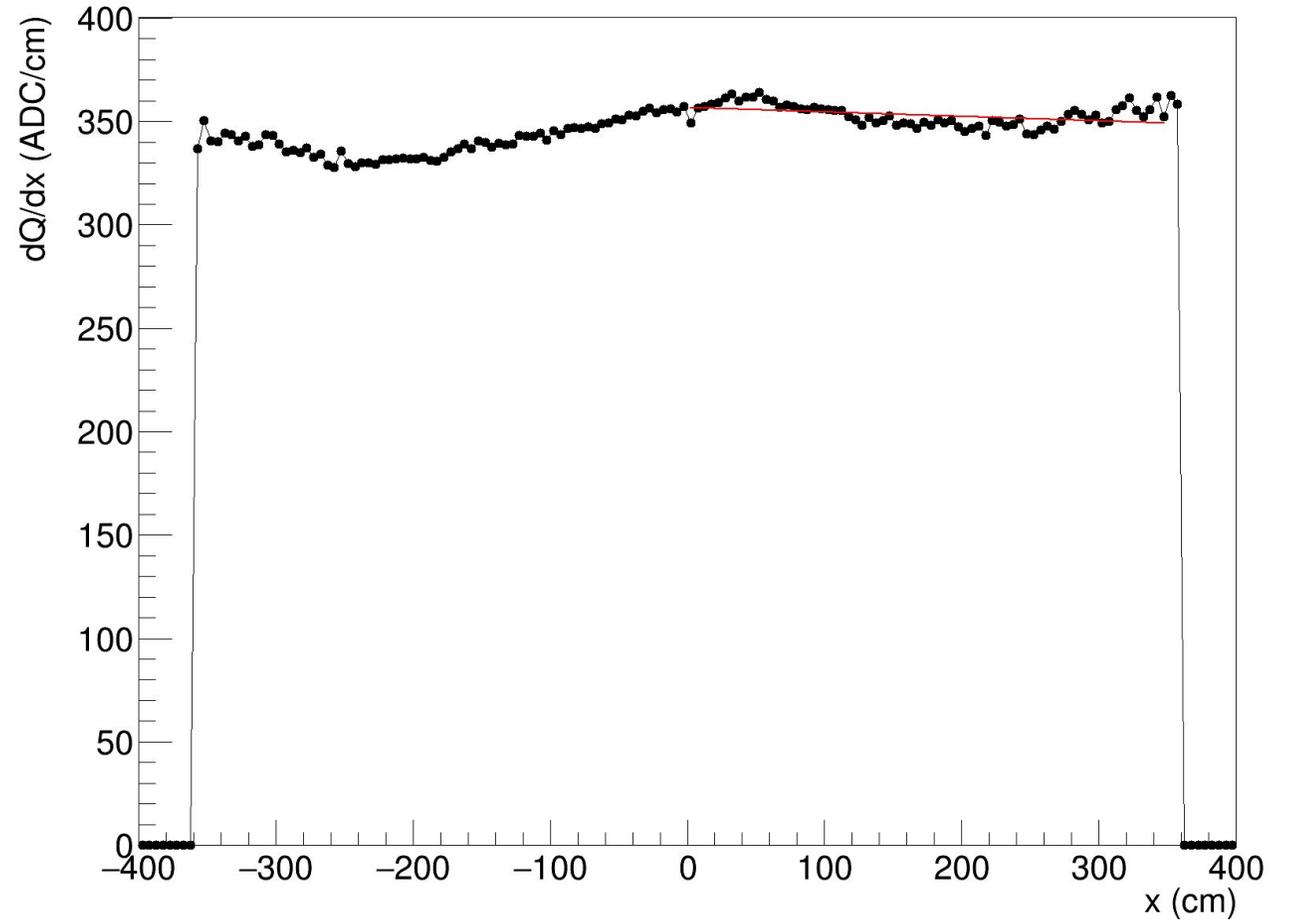

dQ/dx vs X-coord

Run 5308

e- lifetime for $x < 0$: $-38849.8 \mu\text{s}$

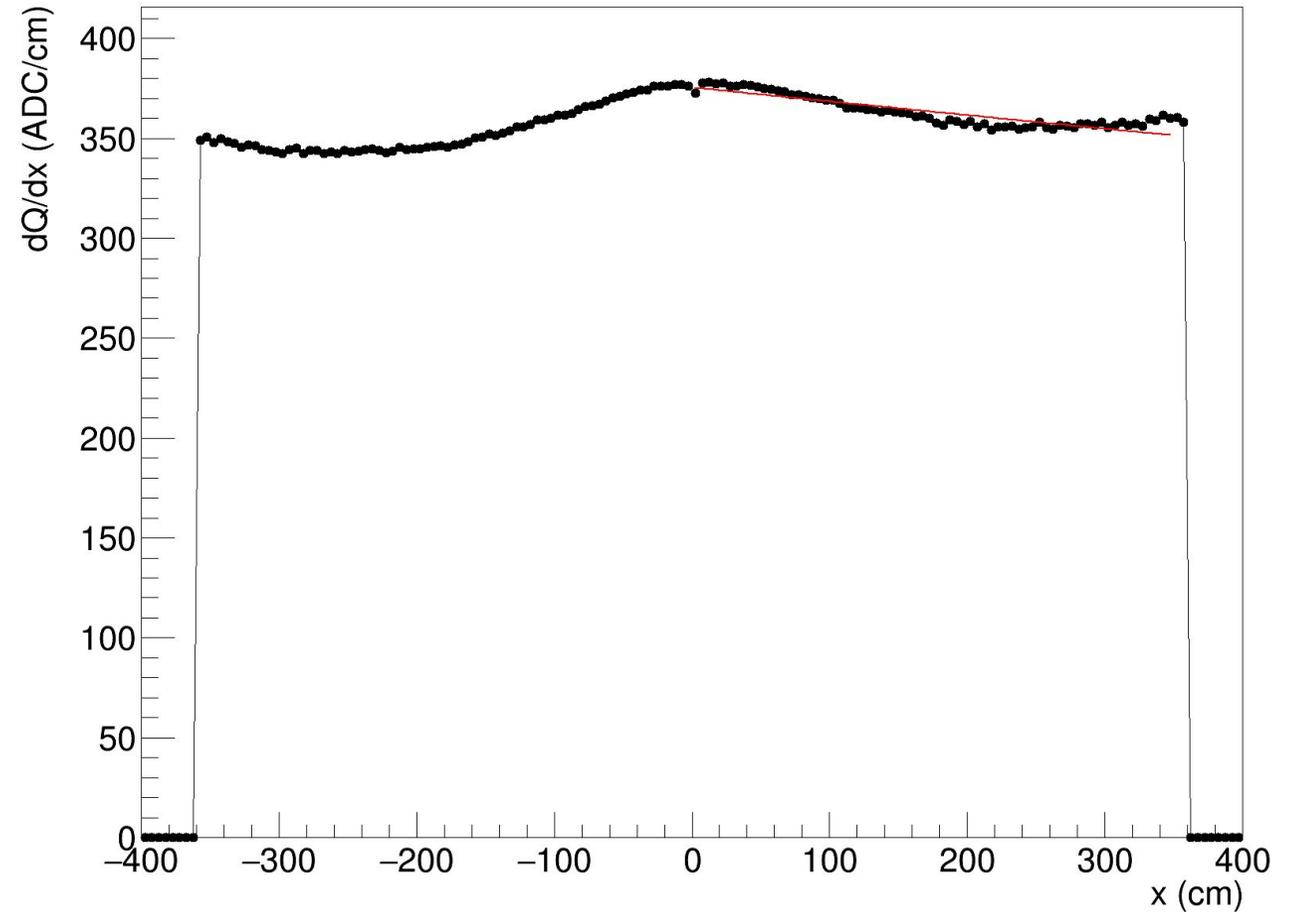

e- lifetime for $x > 0$: $-101754 \mu\text{s}$

Run 5387

e- lifetime for $x < 0$: $-21438.1 \mu\text{s}$

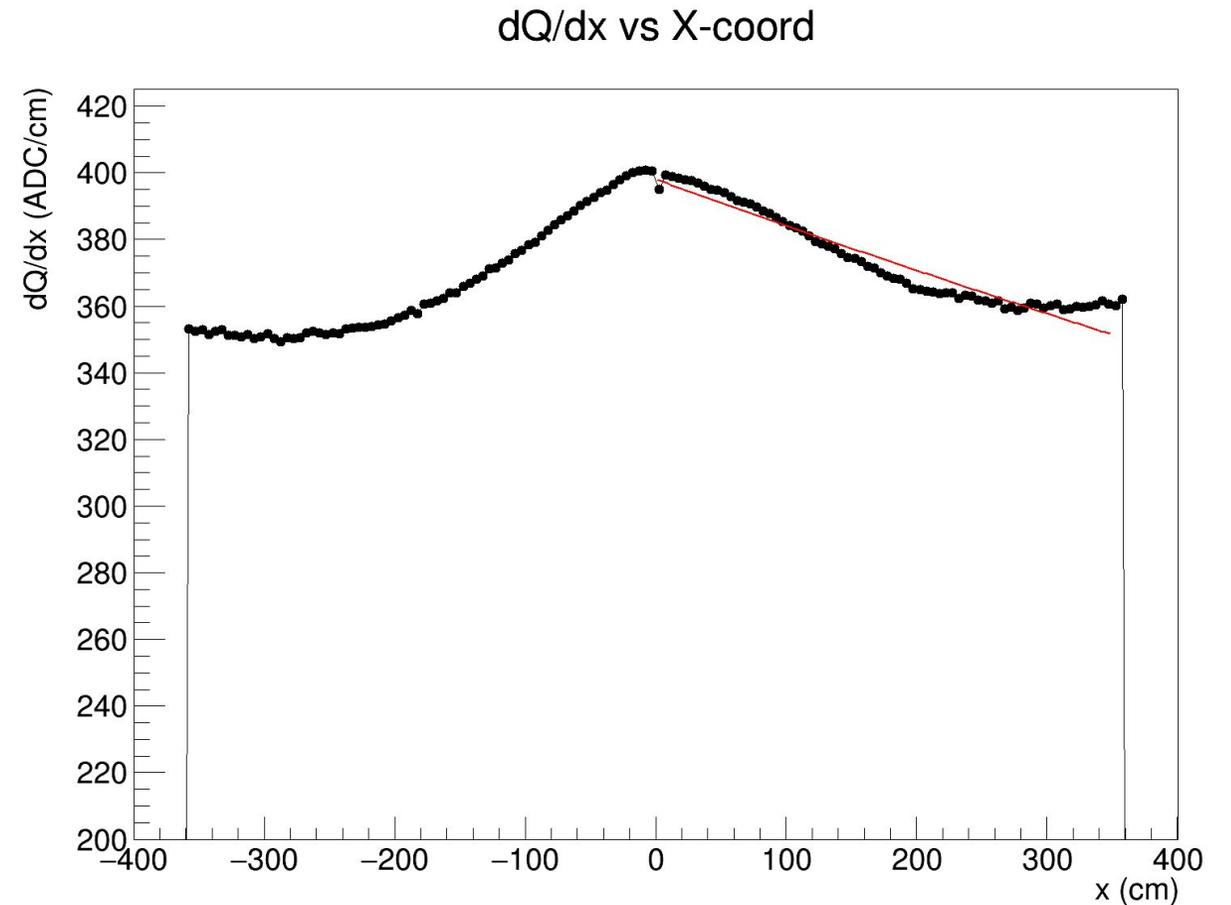

e- lifetime for $x > 0$: $-33131.2 \mu\text{s}$

Run 5460

e- lifetime for $x < 0$: $-14201.9 \mu\text{s}$

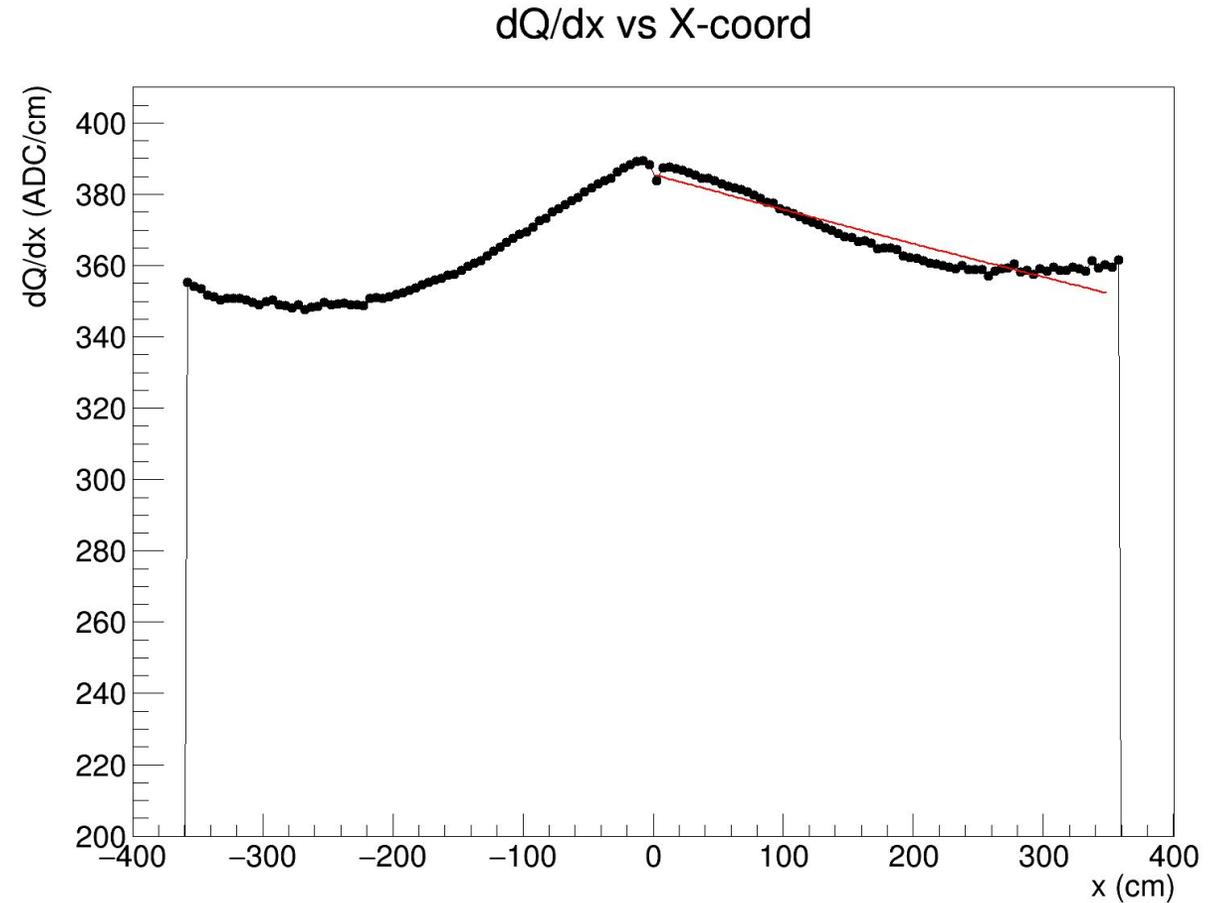

e- lifetime for $x > 0$: $-17566.1 \mu\text{s}$

Run 5814

e- lifetime for $x < 0$: $-18155.2 \mu\text{s}$

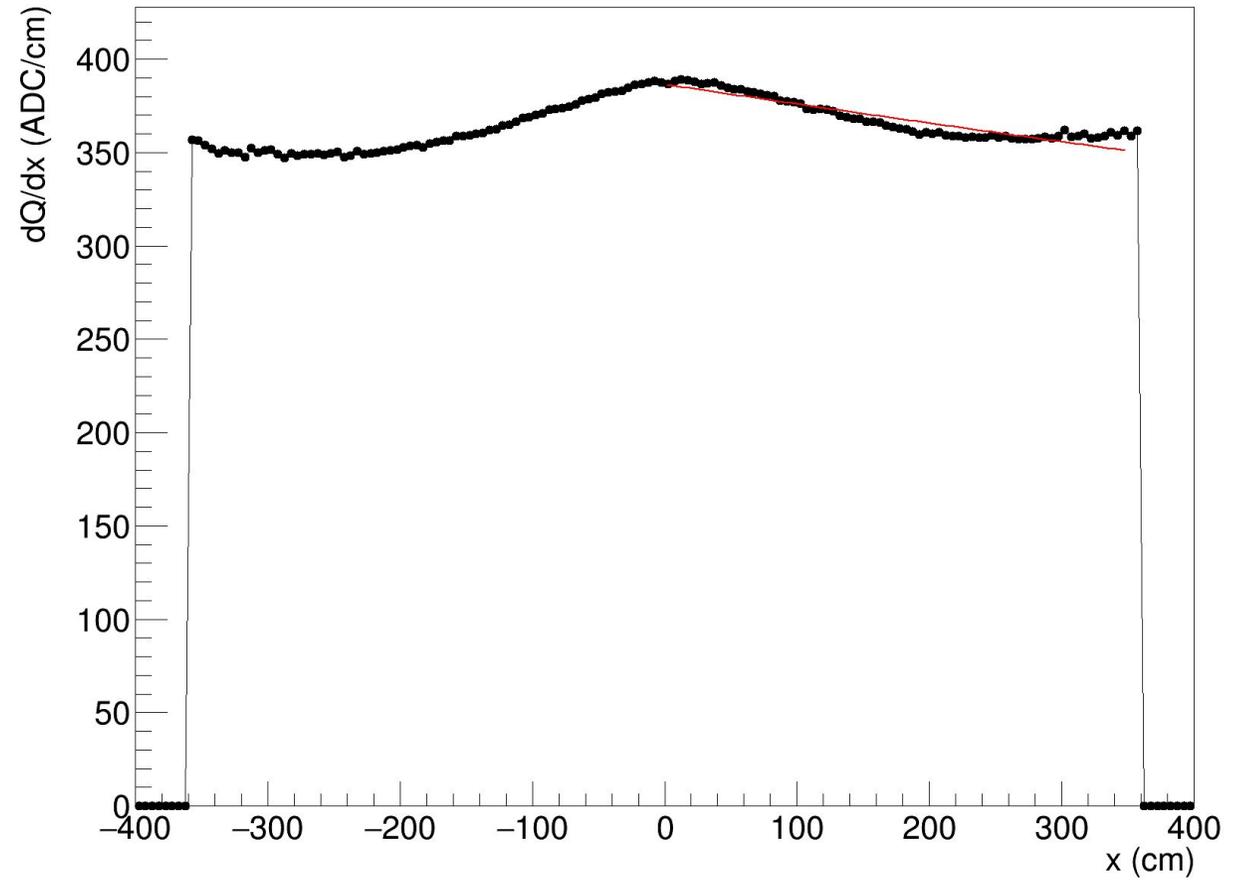

e- lifetime for $x > 0$: $-24171.6 \mu\text{s}$

Run 5815

e- lifetime for $x < 0$: $-18649.2 \mu\text{s}$

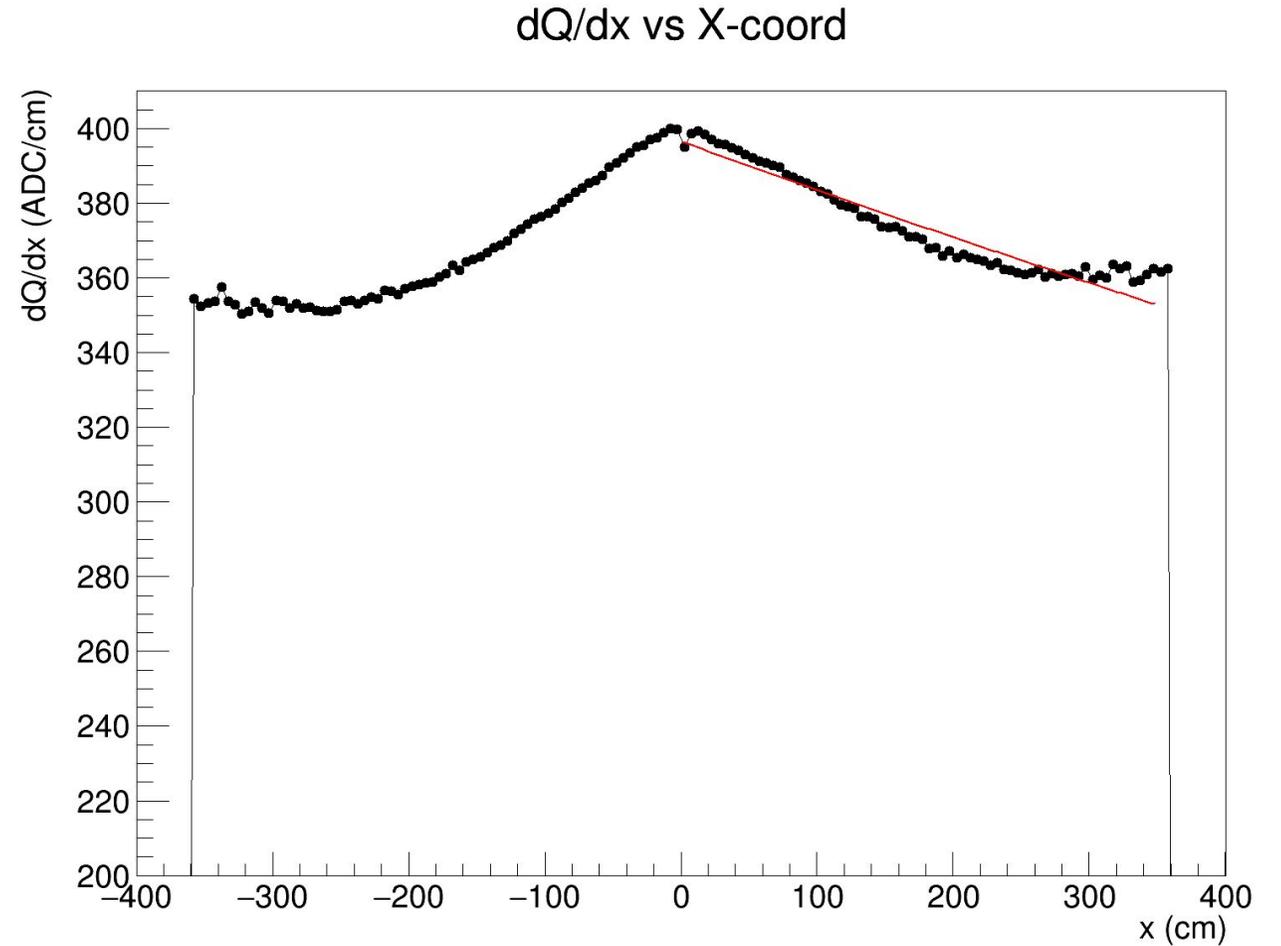

e- lifetime for $x > 0$: $-22659.1 \mu\text{s}$

Run 5844

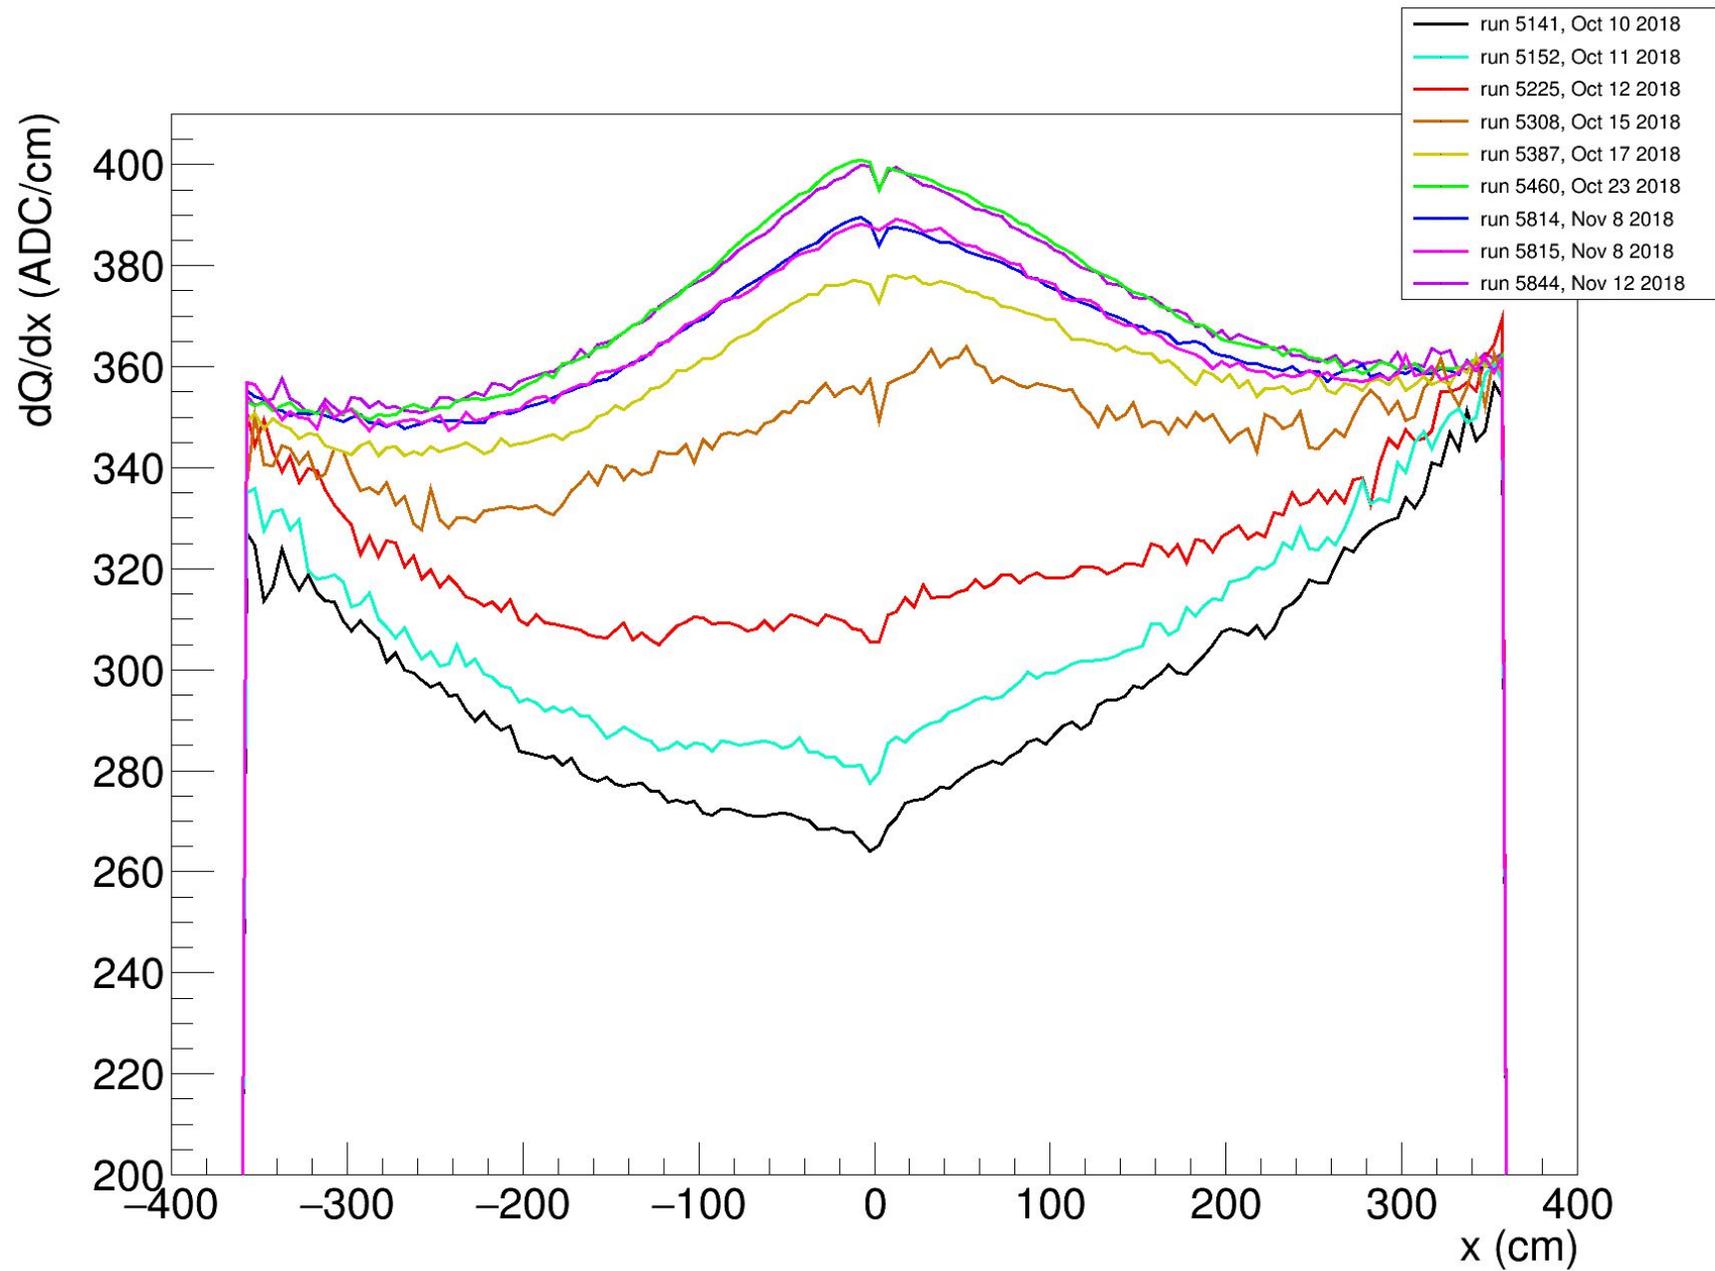

e- lifetime for $x < 0$: $-15321.6 \mu\text{s}$

e- lifetime for $x > 0$: $-18685.5 \mu\text{s}$

Summary

Date	Run	# Events	Processed Events	Lifetime (x>0) (μs)	Lifetime (x<0) (μs)	Avg. lifetime (μs)	Q_A/Q_C (x>0)	Q_A/Q_C (x<0)	Q_A/Q_C (avg.)

Q_A/Q_C calculation

$$Q_A/Q_C = \exp(-t/\tau)$$

- Q_A = charge at anode
- Q_C = charge at cathode
- t = full drift time (2.25 ms for the 3.6 m drift)
- τ = e- lifetime
