

MILO VERMEULEN — 14-3-2019

UPDATE ON π^0 ANALYSIS USING PANDORA RECONSTRUCTION

BACKGROUND

- ▶ Good shower reconstruction necessary for π^0 reconstruction
- ▶ Pandora currently the standard
- ▶ This presentation: π^0 shower accuracy in 10kt and ProtoDUNE models from analyst's perspective
- ▶ Preliminary π^0 reconstruction

VERY FIRST LOOK

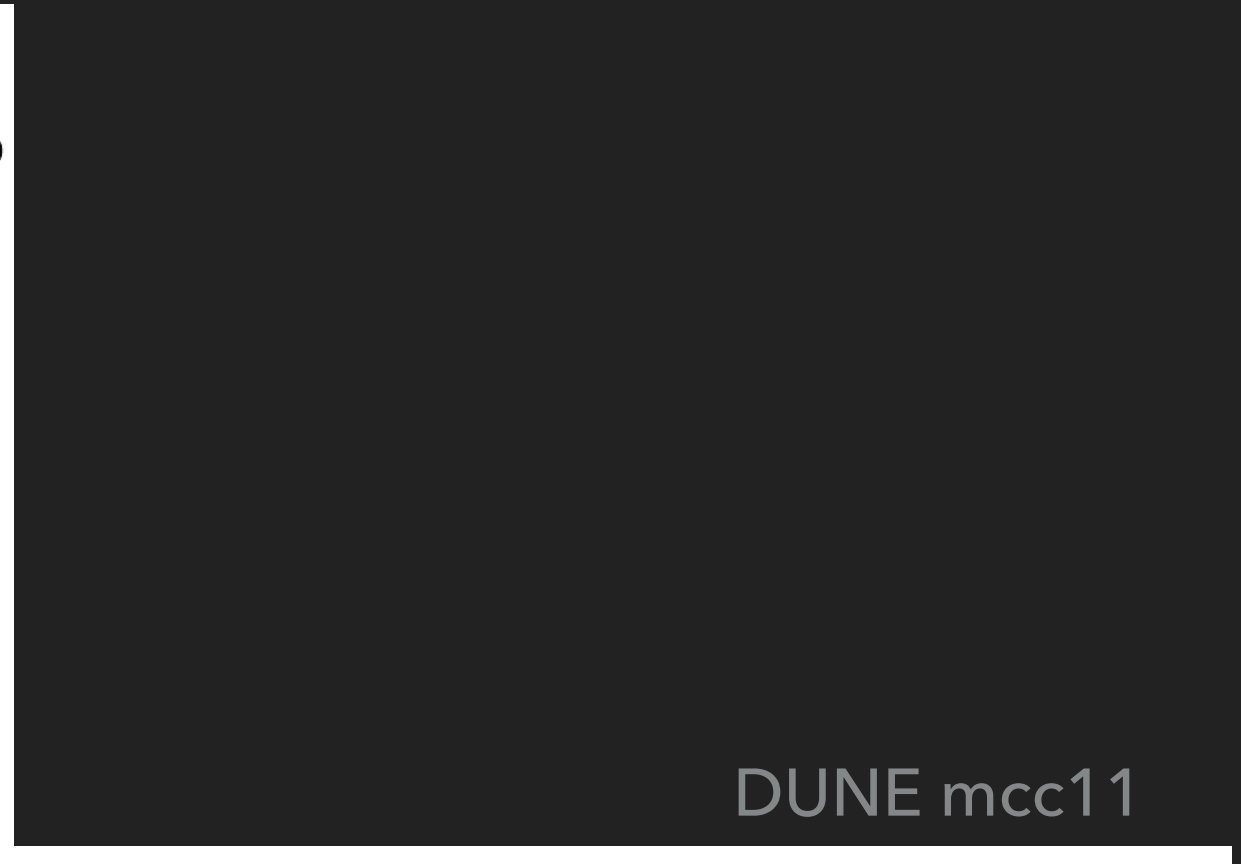

- ▶ Simply compare MC photon and reco shower
- ▶ Record distance, relative angle

1 GeV π^0 in DUNE

ProtoDUNE mcc11

DUNE mcc11

ZOOM AND ENHANCE!

DUNE mcc11 – 10000 events

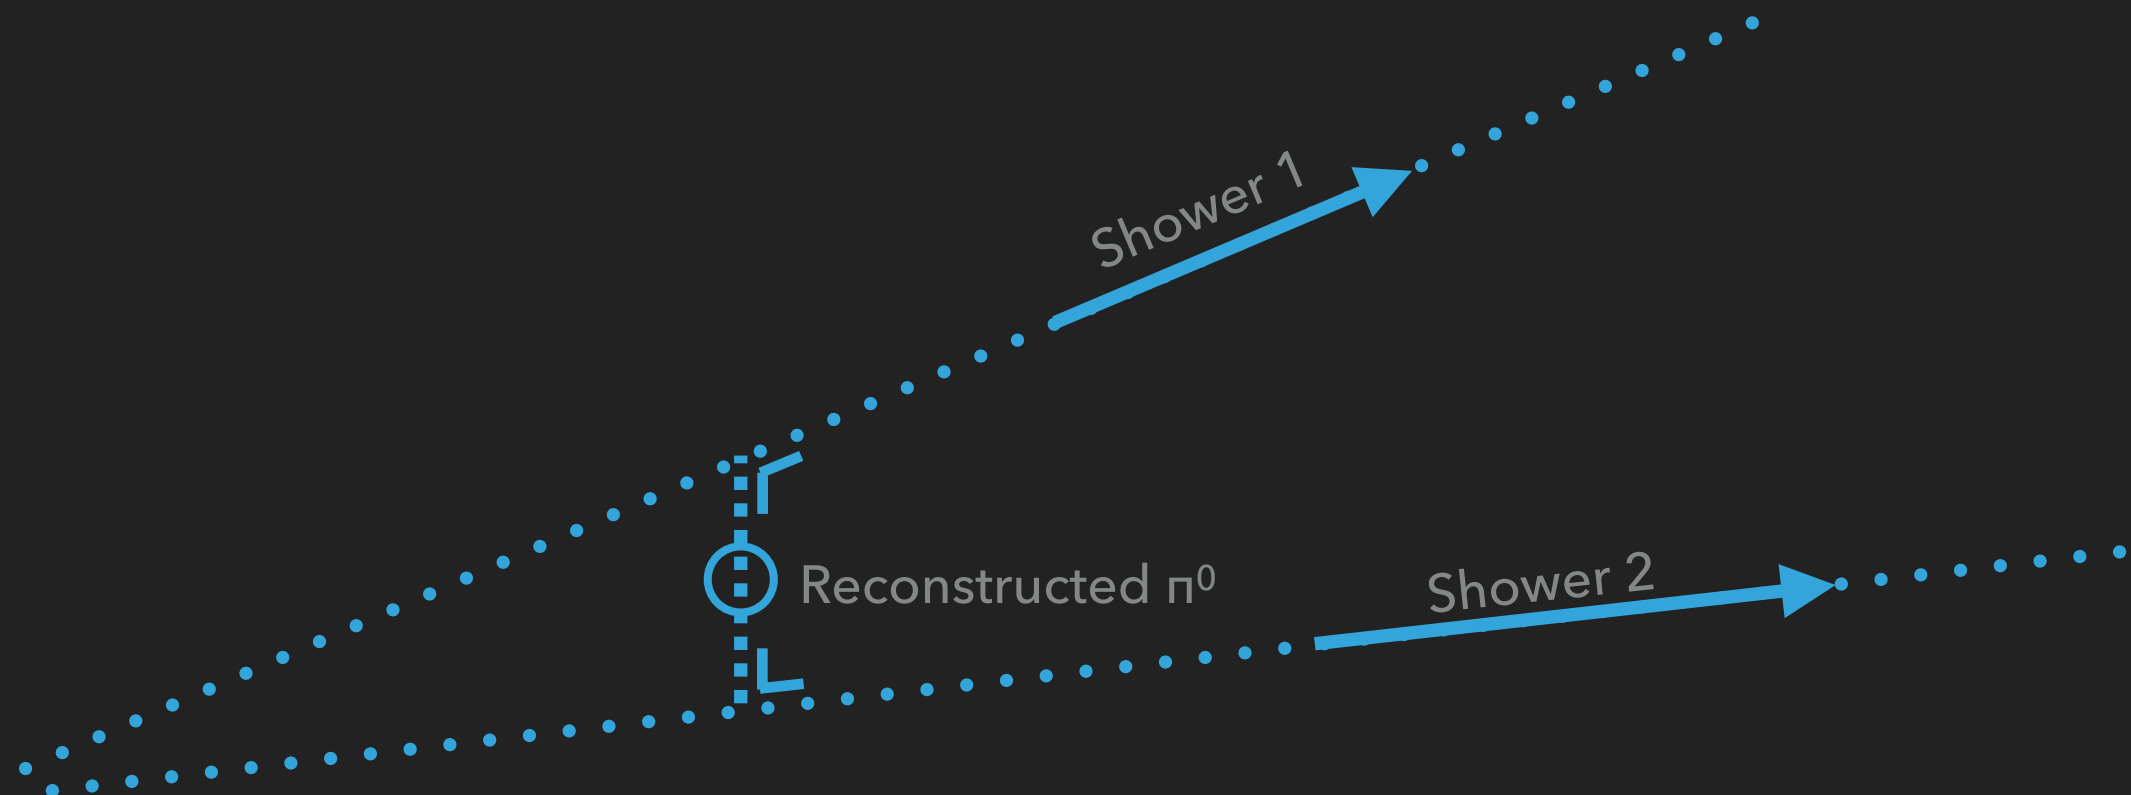

CHALLENGE 1: SHOWER MATCHING

- ▶ Could investigate more sophisticated matching including relative angle, energy
- ▶ Alternatively, link showers to photons via backtracker

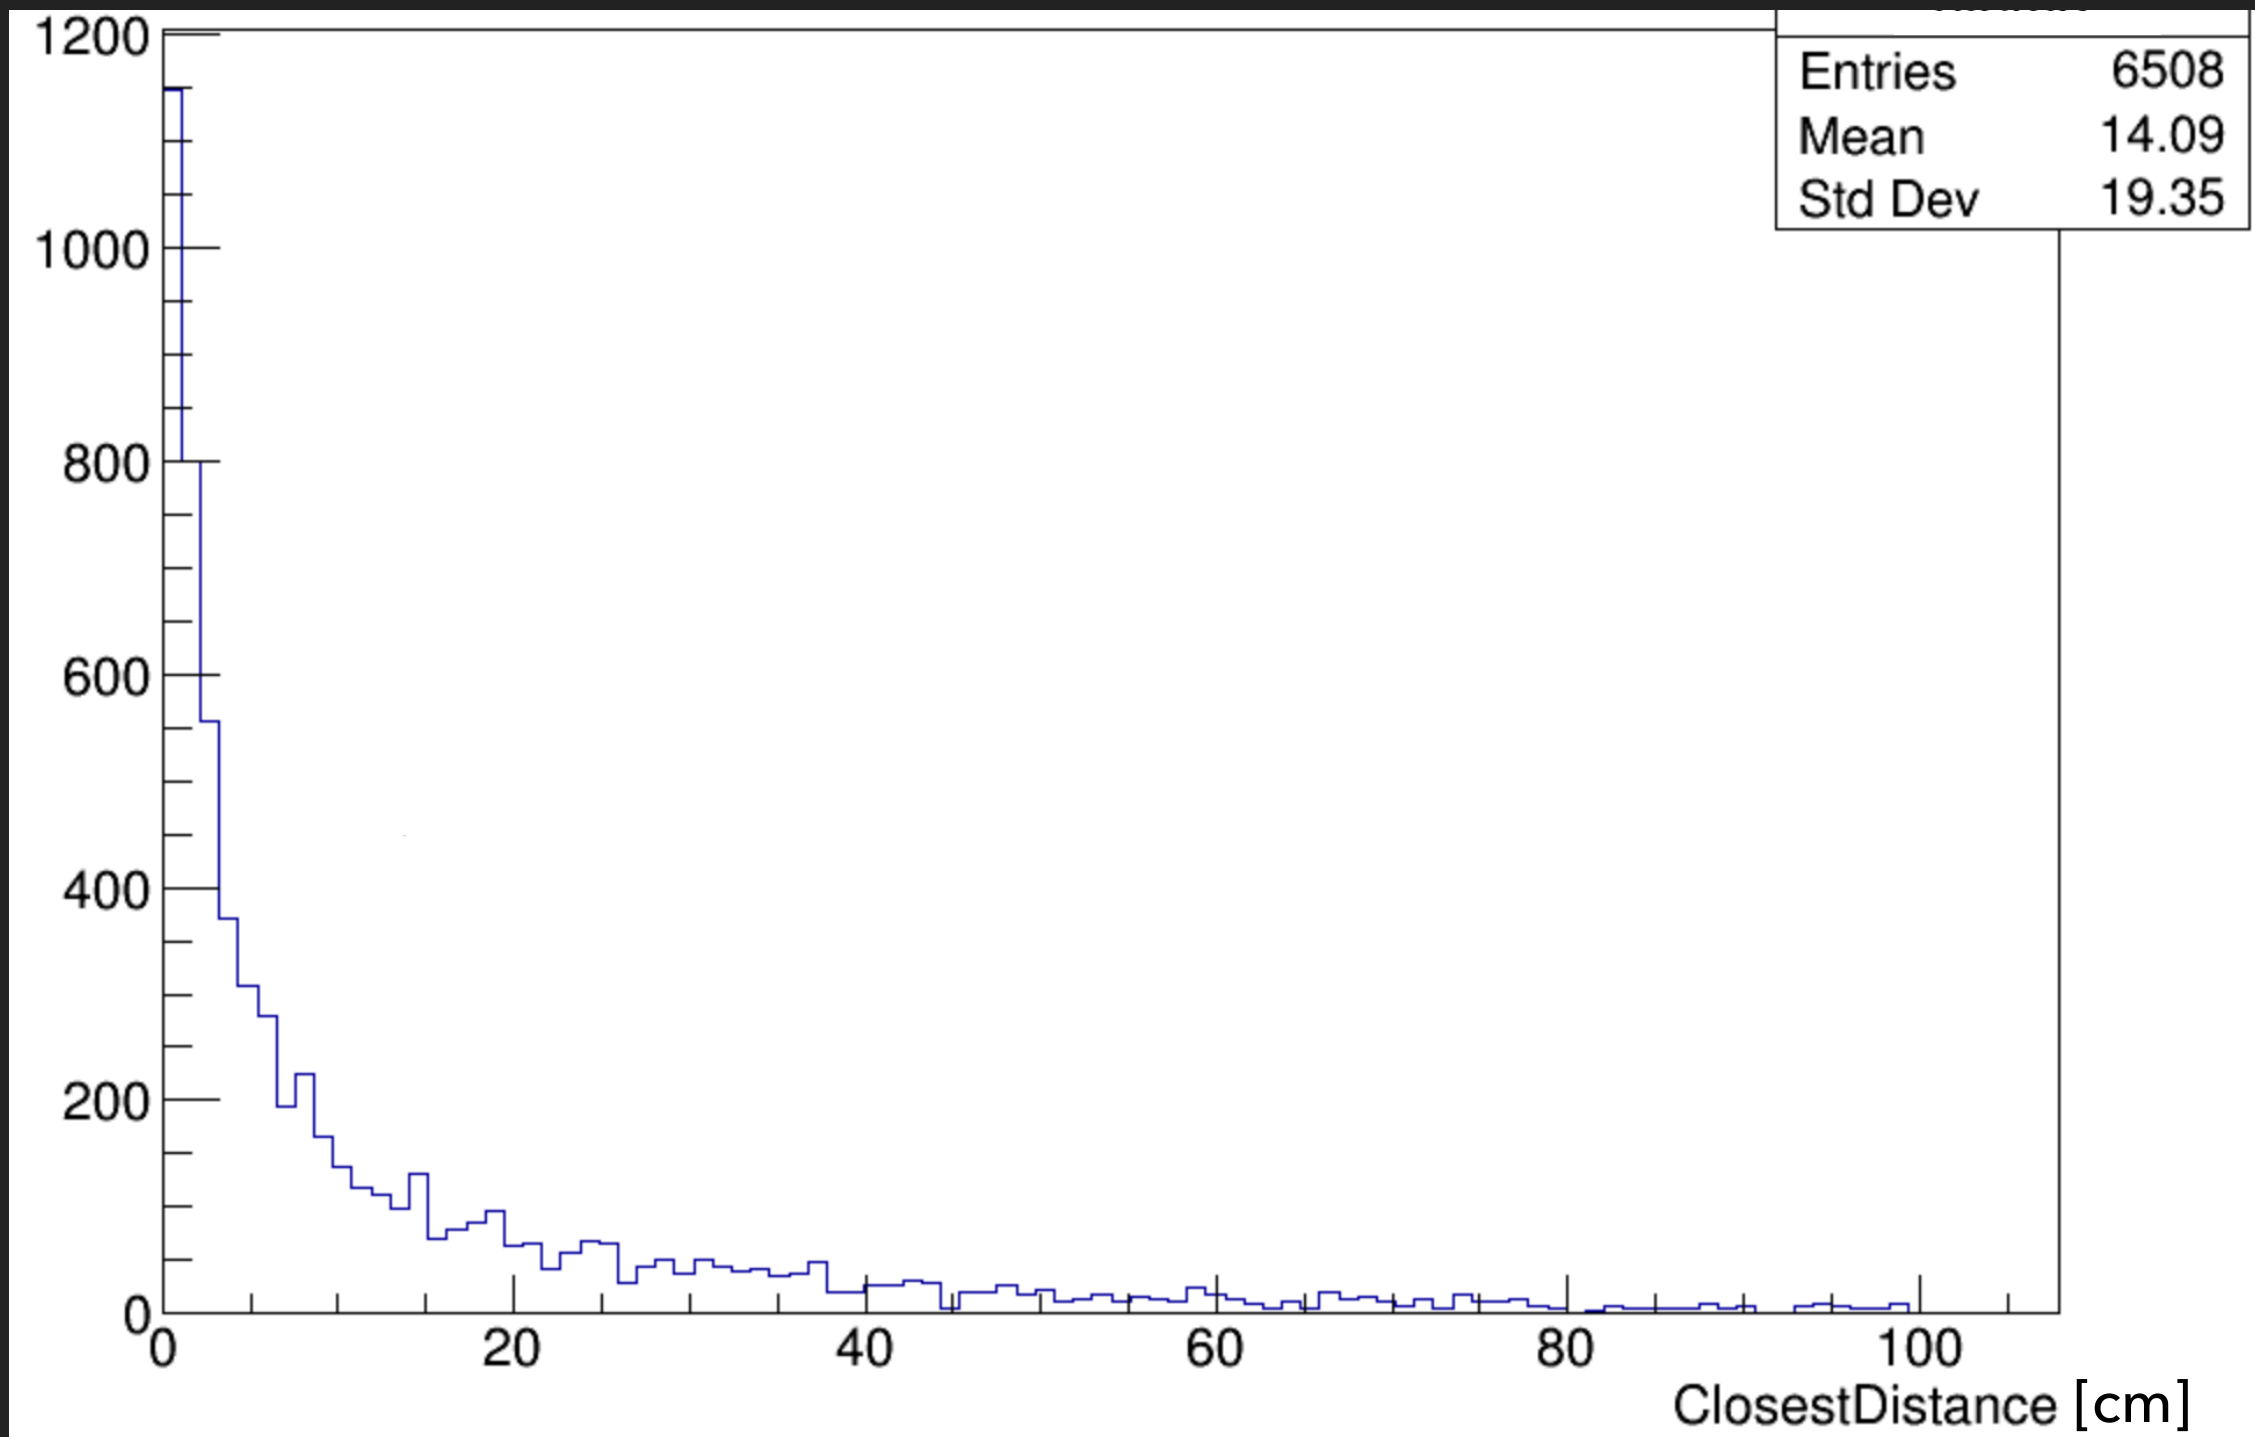

CHALLENGE 2: NEAREST POINT FINDING

- ▶ Find shortest distance between back-tracked matched showers to judge quality of reconstruction
 - ▶ Smaller closest distance points to a better π^0 determination
- ▶ This is something that can be done without MC information

CHALLENGE 2: NEAREST POINT FINDING — CLOSEST DISTANCE

10000 10kt events

CHALLENGE 2: NEAREST POINT FINDING — MC/RECO COMPARISON

CHALLENGE 2: NEAREST POINT FINDING — MC/RECO COMPARISON

10000 10kt events

CHALLENGE 2: NEAREST POINT FINDING — MC/RECO COMPARISON

10000 10kt events

INVARIANT MASS FROM PHOTONS

10000 10kt events

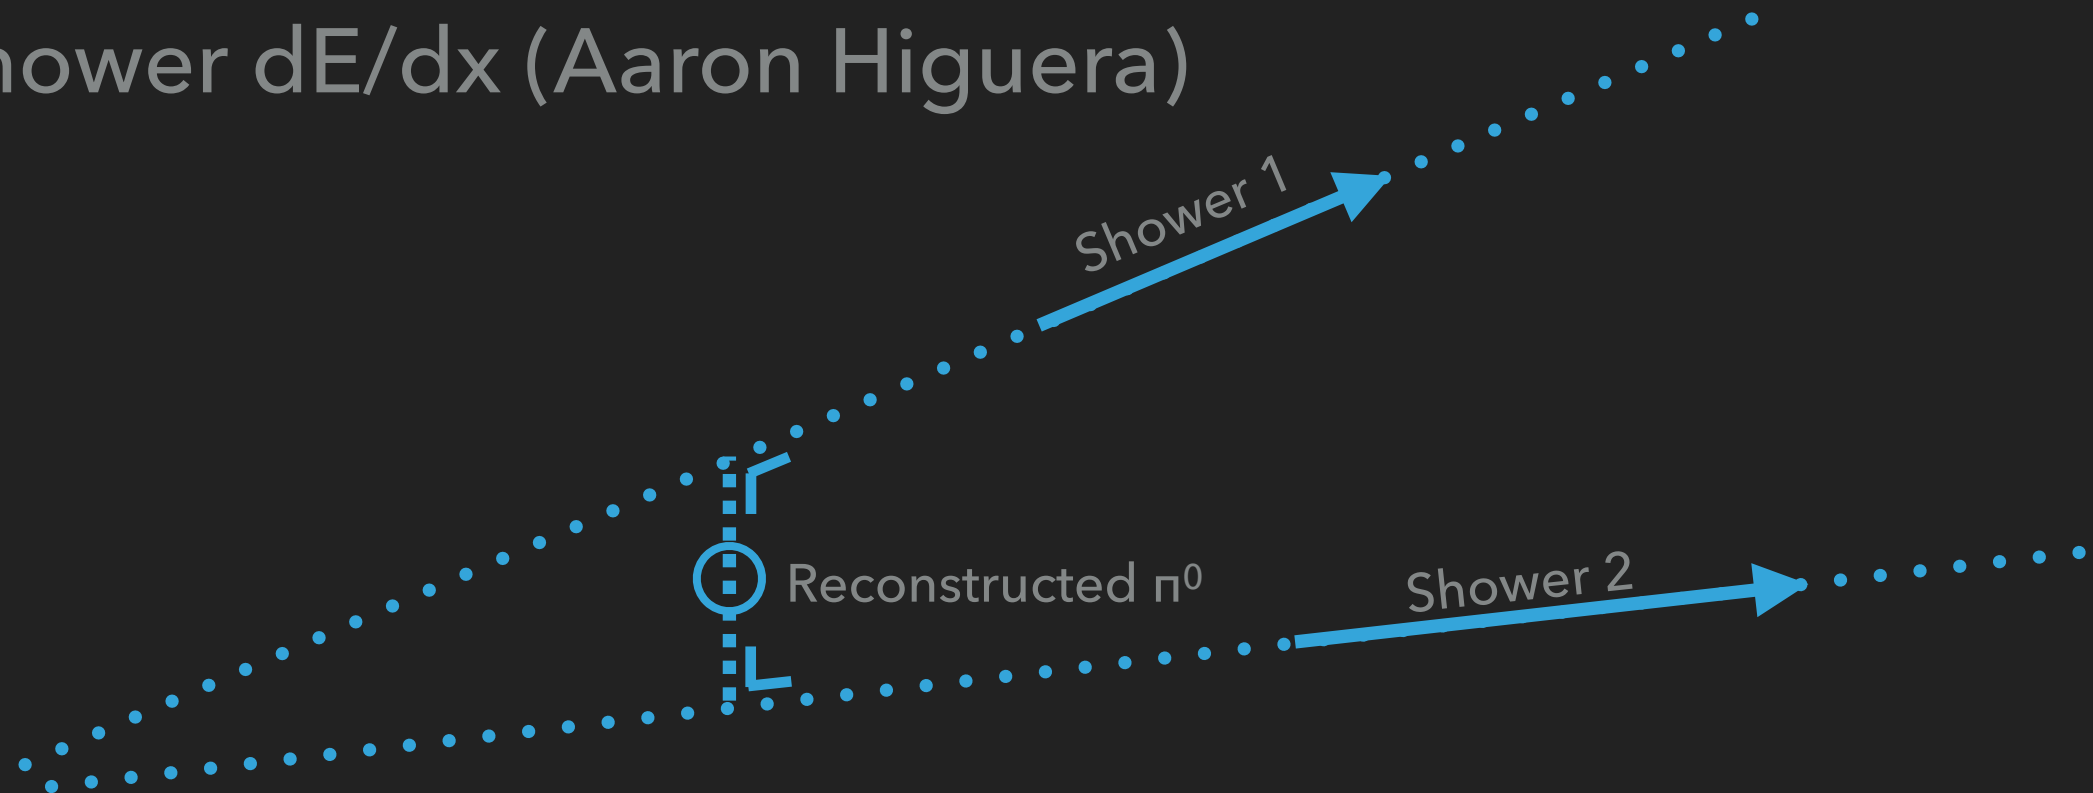

INVARIANT MASS FROM SHOWERS

10000 10kt events

DATA-DRIVEN ANALYSIS

- ▶ Use purely reconstruction information to find π^0 s
 1. Shortest distance between shower lines
 2. Reconstructed invariant mass
 3. Shower dE/dx (Aaron Higuera)

DATA-DRIVEN ANALYSIS — SHORTEST DISTANCE BETWEEN SHOWER LINES

- ▶ Same data set as before, now look at all shower pairs

10000 10kt events

DATA-DRIVEN ANALYSIS — INVARIANT MASS

10000 10kt events – max 2 cm between shower lines

DATA-DRIVEN ANALYSIS — DISTANCE TO NEAREST MC π^0

10000 10kt events – max 1 cm between shower lines and inv. mass < 0.2 GeV

DATA-DRIVEN ANALYSIS — DISTANCE TO NEAREST MC π^0

10000 10kt events – max 1 cm between shower lines and inv. mass < 0.2 GeV

DATA-DRIVEN ANALYSIS — DISTANCE TO NEAREST MC π^0

10000 10kt events – max 1 cm between shower lines and inv. mass < 0.2 GeV

FUTURE PLANS

- ▶ Investigate bad shower matching in ProtoDUNE
- ▶ Continue to develop shower matching algorithm
 - ▶ Distinguish photon showers from electron shower
- ▶ Refine cuts to have least false positives/negatives
