

DUNE Production Update

Ivan Furic, Ken Herner

DUNE Computing

6 May 2019

Production work

- Catching up on DP MC request
 - Currently staying off of FermiGrid to allow LBL osc. fits to finish
 - Switched to 10-event jobs; 2500 MB typically (99%) enough. Run gen+g4+detsim+reco consecutively in the job (calls lar 4 separate times)
- Catching up on cosmic reprocessing for past few weeks
 - Someone played a bit with the run spreadsheet, which messed up Pengfei's cron script. Explained to the DAQ folks that they should not assume things like that don't have consequences.
 - Their response was more or less that we should query the logbook instead, but that comes with its own problems. DB is best.
 - Once LBL fits finish, plan to reclaim extra quota given over to analysis
- Talking to a few sites about lack of jobs and/or held pilots. Might be some lingering fallout from the FNAL transition to InCommon certs
