

# Change to geometry code affecting some drift distance calculations

Gianluca Petrillo

SLAC National Accelerator Laboratory, U.S.A.

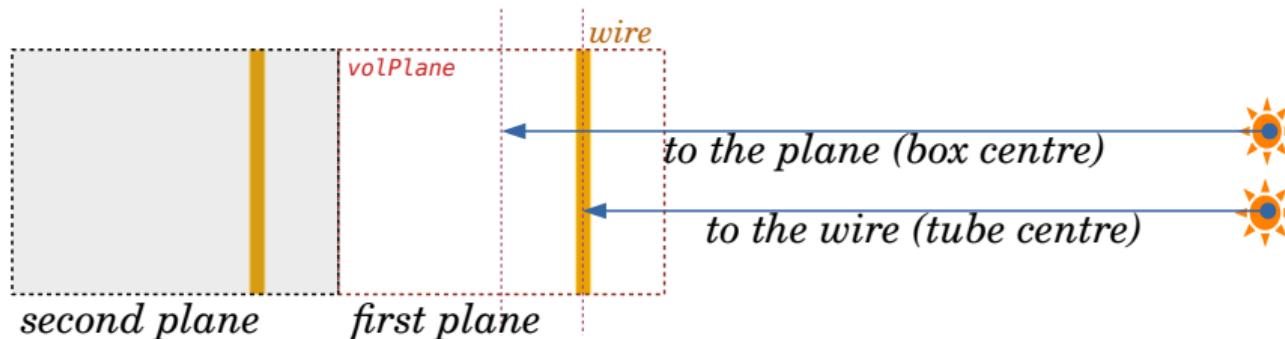

LArSoft Coordination Meeting, May 21, 2019

# One-slide explanation of the change

- wire plane in GDML is its own volume
  - box sized — quite thick for a plane
  - *contains* the volumes of the wires
- wires must be placed *somewhere within* the wire plane box
  - `geo::TPCGeo::PlaneLocation()` reports the *center* of the box
  - LArG4 associates use it to determine drift distance

The latter is correct only if wires happen to lie on the median plane of the plane box.

# Conclusion

- I have discovered the issue (now [#22431](#)) looking at ArgoNeuT geometry
- if wires lie in the middle of the wire plane box, not a problem  
(e.g. *not a problem for DUNE 10kt geometry, it seems*)
- otherwise, still not a big deal (what's 2 mm of drift among planes?)
- fix to `geo::TPCGeo::PlaneLocation()` was directly put into `develop`  
(and I was chastised for that, since it makes hard to trace back changes)
- nevertheless I consider `geo::TPCGeo::PlaneLocation()` *deprecated*; better options:
  - `geo::PlaneGeo::GetCenter()`: less fragile
  - `geo::TPCGeo::DistanceToReferencePlane()`, `geo::PlaneGeo::DriftPoint()`,  
`geo::PlaneGeo::DistanceFromPlane()`: drift-direction aware
- in fact, can we *officially deprecate it?*

# Other stuff I recently pushed

- added utility functions `util::counter()`, `util::zip()`, `util::enumerate()`
  - reminiscent of the Python equivalent functions
  - documented in [Doxygen](#)
  - one day they will be made obsolete by *range* library...
- added TickLabel option to `raw::OpDetWaveforms` dumper module, to dump **the time of each sample** in the waveform:

```
The event run: 1 subRun: 23 event: 1 contains data for 3520 optical detector channels
A pedestal of 8000 counts will be subtracted from all ADC readings.
on channel #0 (time stamp: 127.916): 2636 time ticks
content of the channel (20 ticks per line):
  0 |   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0
    | [... repeated 23 more times ]
  480 |   0   0   0   0   0   0   0   0   0   0   0   0   -1   -1   -1   -4   -9
  500 |  -11  -10  -9  -8  -6  -5  -3  -2  -2  -1  -1  -1  -1  -1  -1  -1  -1  -1  0
```

- deprecated for removal an obscure data product proxy method (`getIf()`) that nobody uses (for a reason); [Doxygen example](#) also shows how to update the code
