

**Winter Aspen 2023**

# Dark SRF pathfinder result and beyond

**Zhen Liu**  
**University Minnesota**

**03/30/2023**

Mainly based upon A. Romanenko et al, [2301.11512](#)

# Intro

Kinematically mixed dark photons are well-motivated.

There are many past, ongoing and future searches.

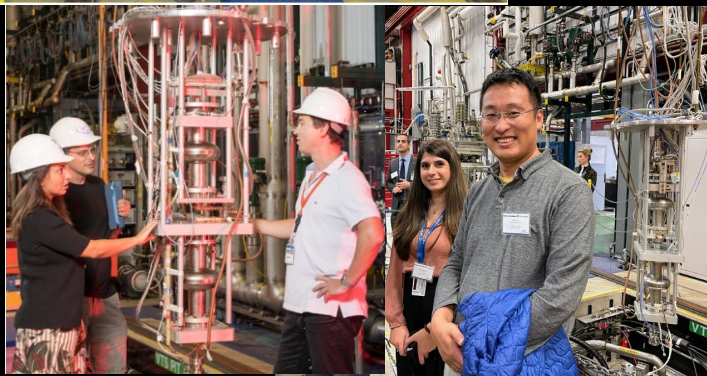

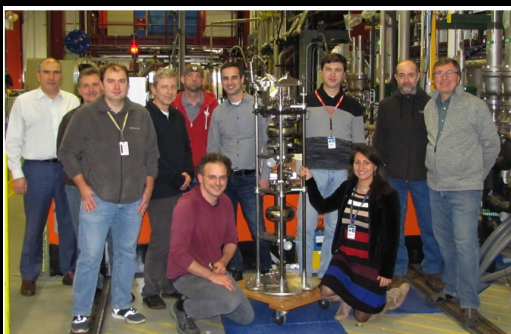

Today, I report the pathfinder results of one such efforts and discuss its future.

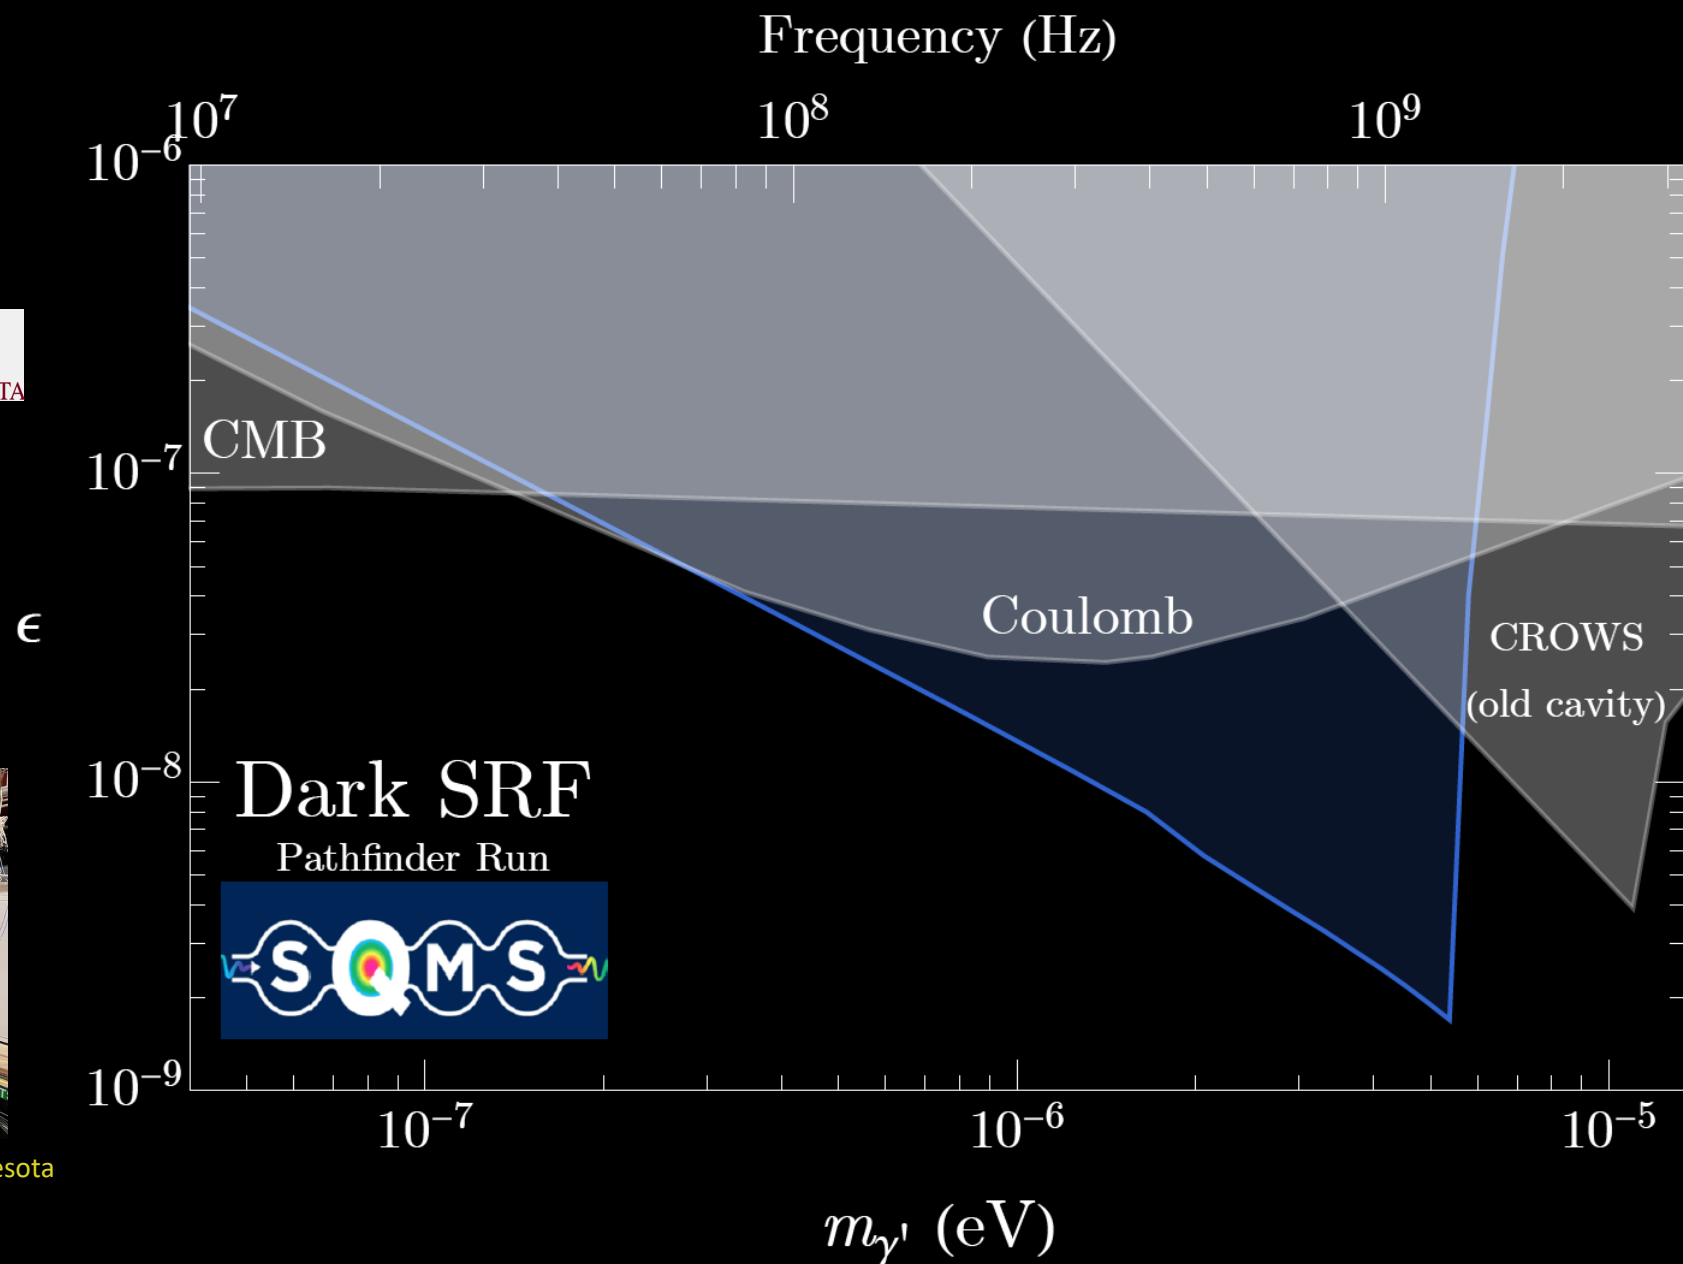

Graham et al, Phys.Rev. D90 (2014) no.7, 075017

J. Hartnett et al, Phys. Lett. B 698 (2011) 346  
J. Jaeckel and A. Ringwald, Phys. Lett. B 659, 509 (2008)

# Pathfinder result

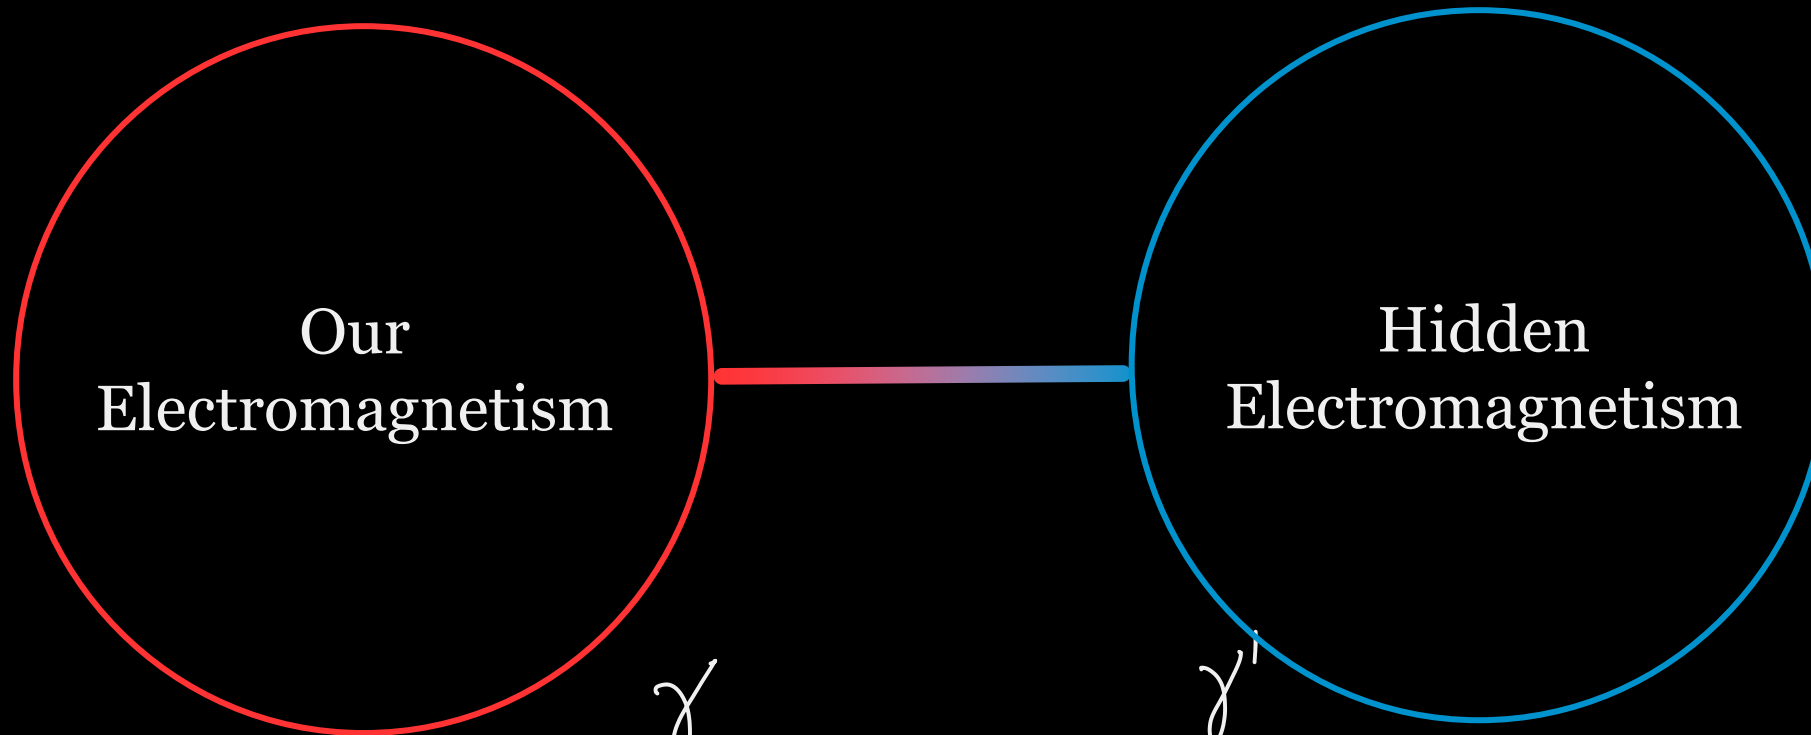

Our pathfinder run results  
already explore new territory!

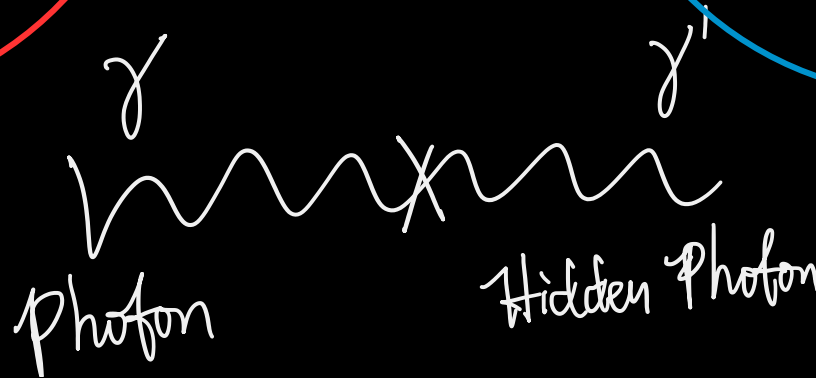

Work was performed at Fermilab and University of Minnesota

# A generic light hidden photon

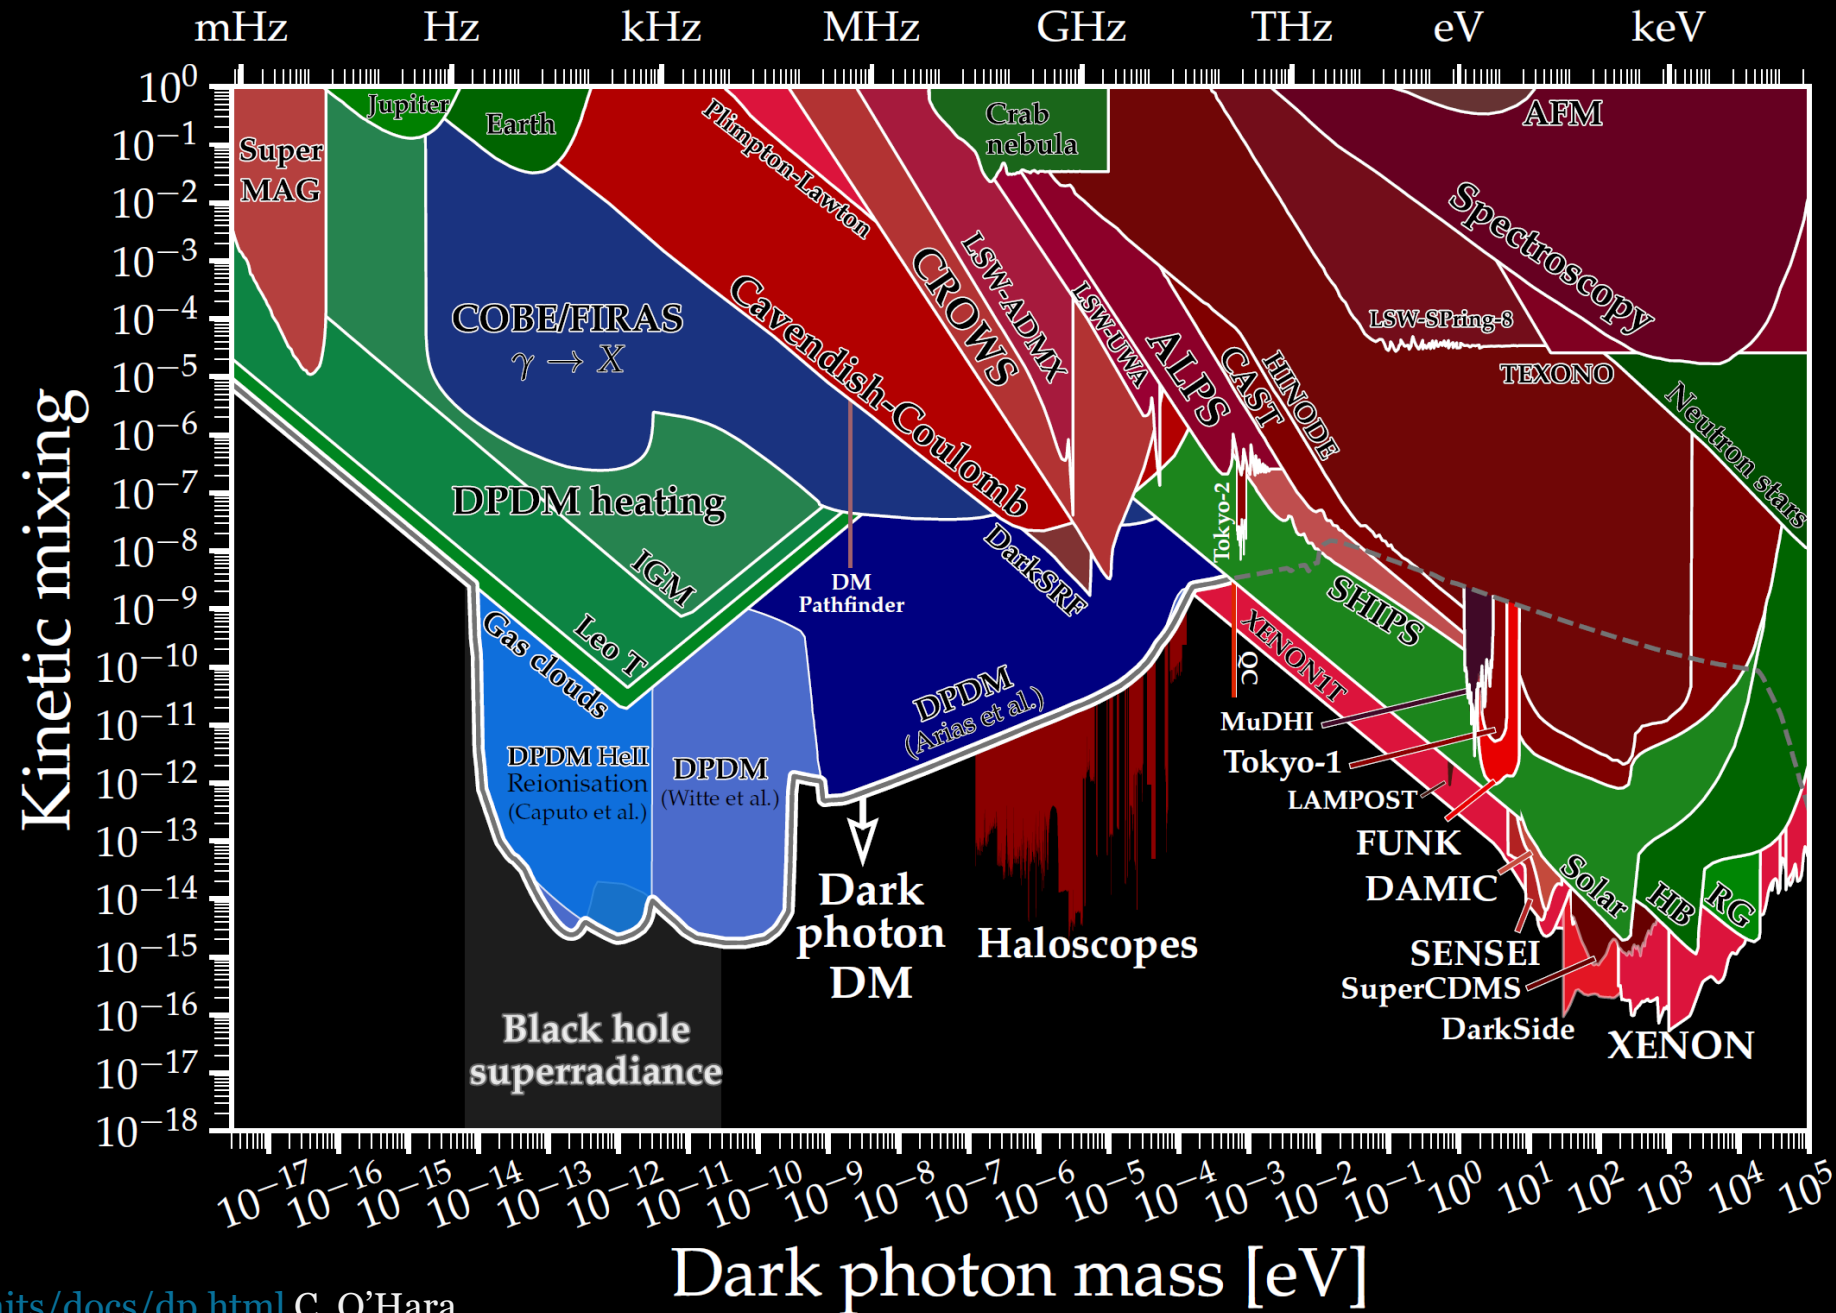

€ determined by UV physics  
One can easily generate it via  
high-scale fermions charged  
under both gauge groups.

$$\mathcal{L} = \mathcal{L}_{\text{SM}} - \frac{1}{4} F'_{\mu\nu} F'^{\mu\nu} + \frac{\epsilon}{2} F'_{\mu\nu} F^{\mu\nu} + \frac{1}{2} m_{\gamma'}^2 A'_\mu A'^\mu$$

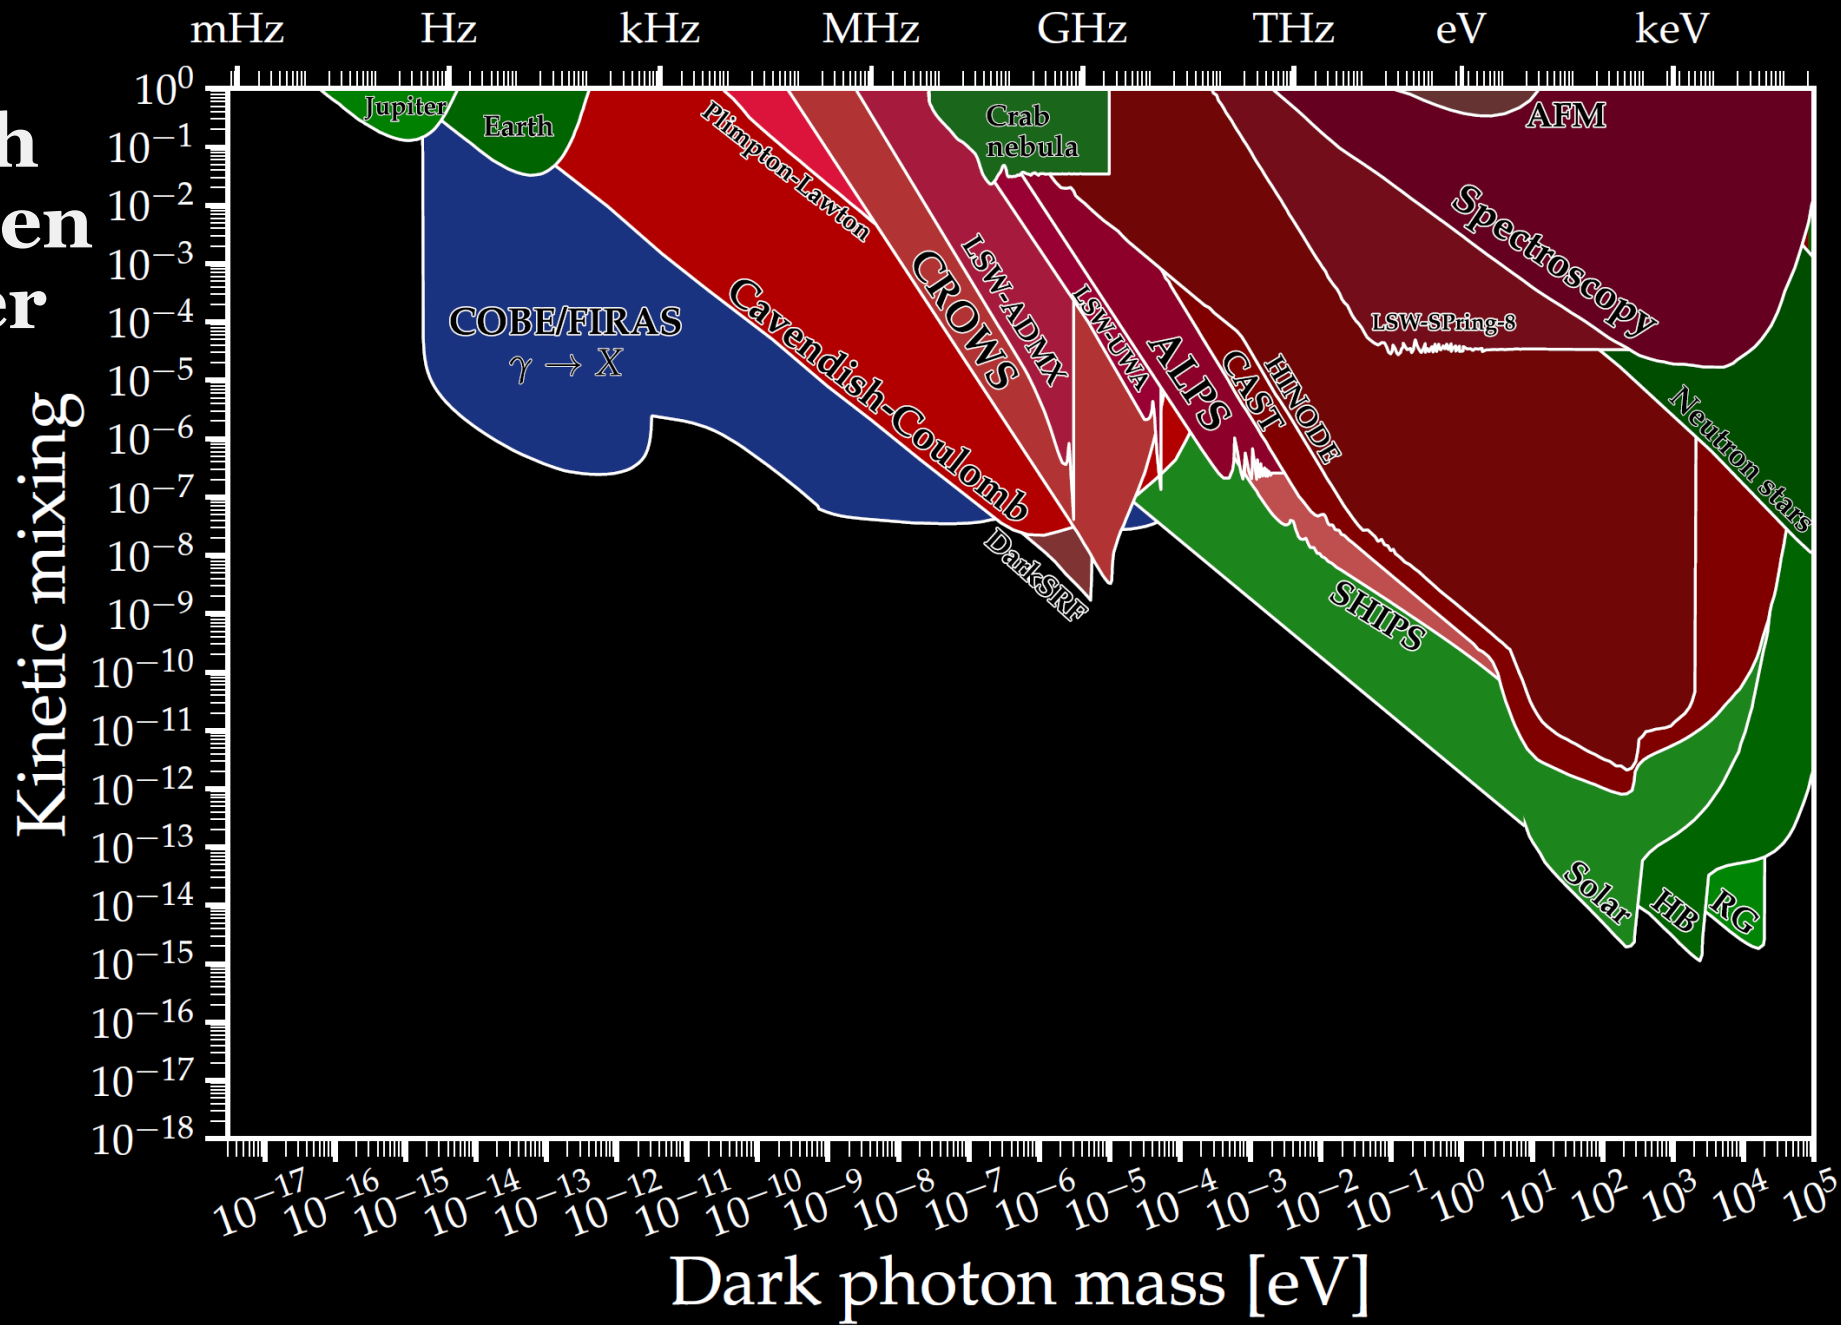

See the discussion on the  $\epsilon$  size, e.g.,  
Gherghetta, Kersten, Olive, Pospelov,

# An Active Program

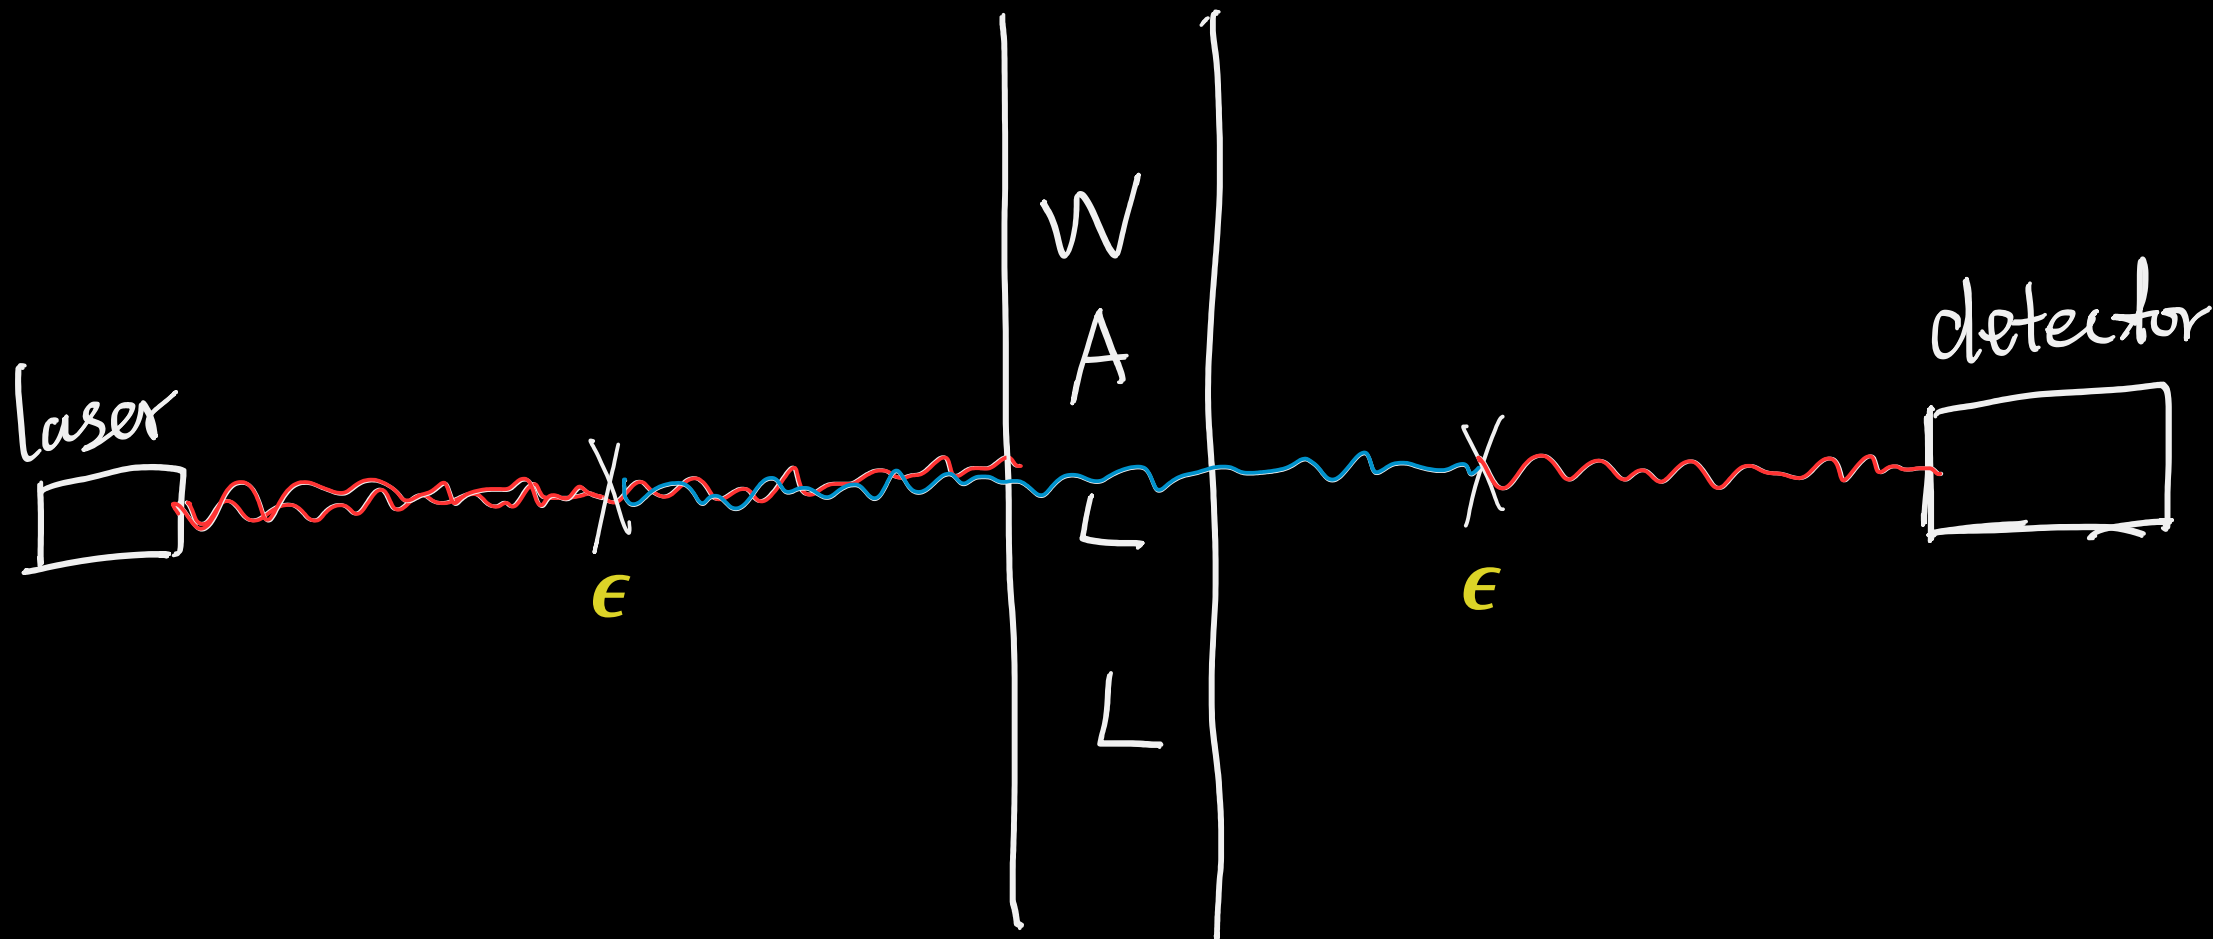

<https://cajohare.github.io/AxionLimits/docs/dp.html> C. O'Hara

An active  
program: much  
less known when  
not dark matter

# What is Dark SRF?

# Light Shining through Wall (LSW)

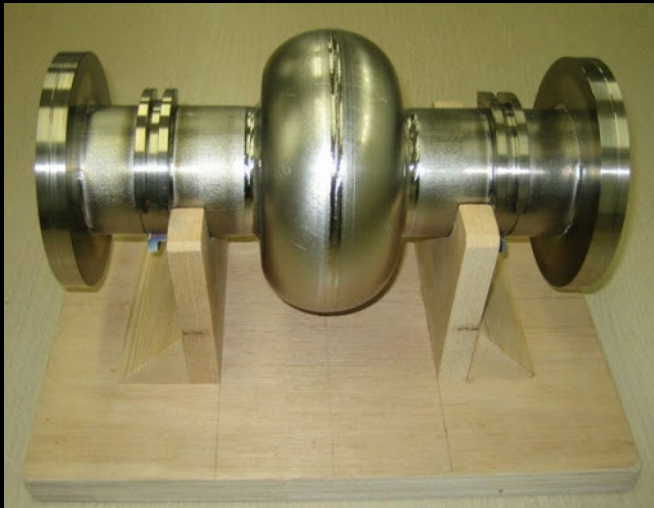

# We have the best SRF for High Energy Accelerators

Superconducting RF Cavities:

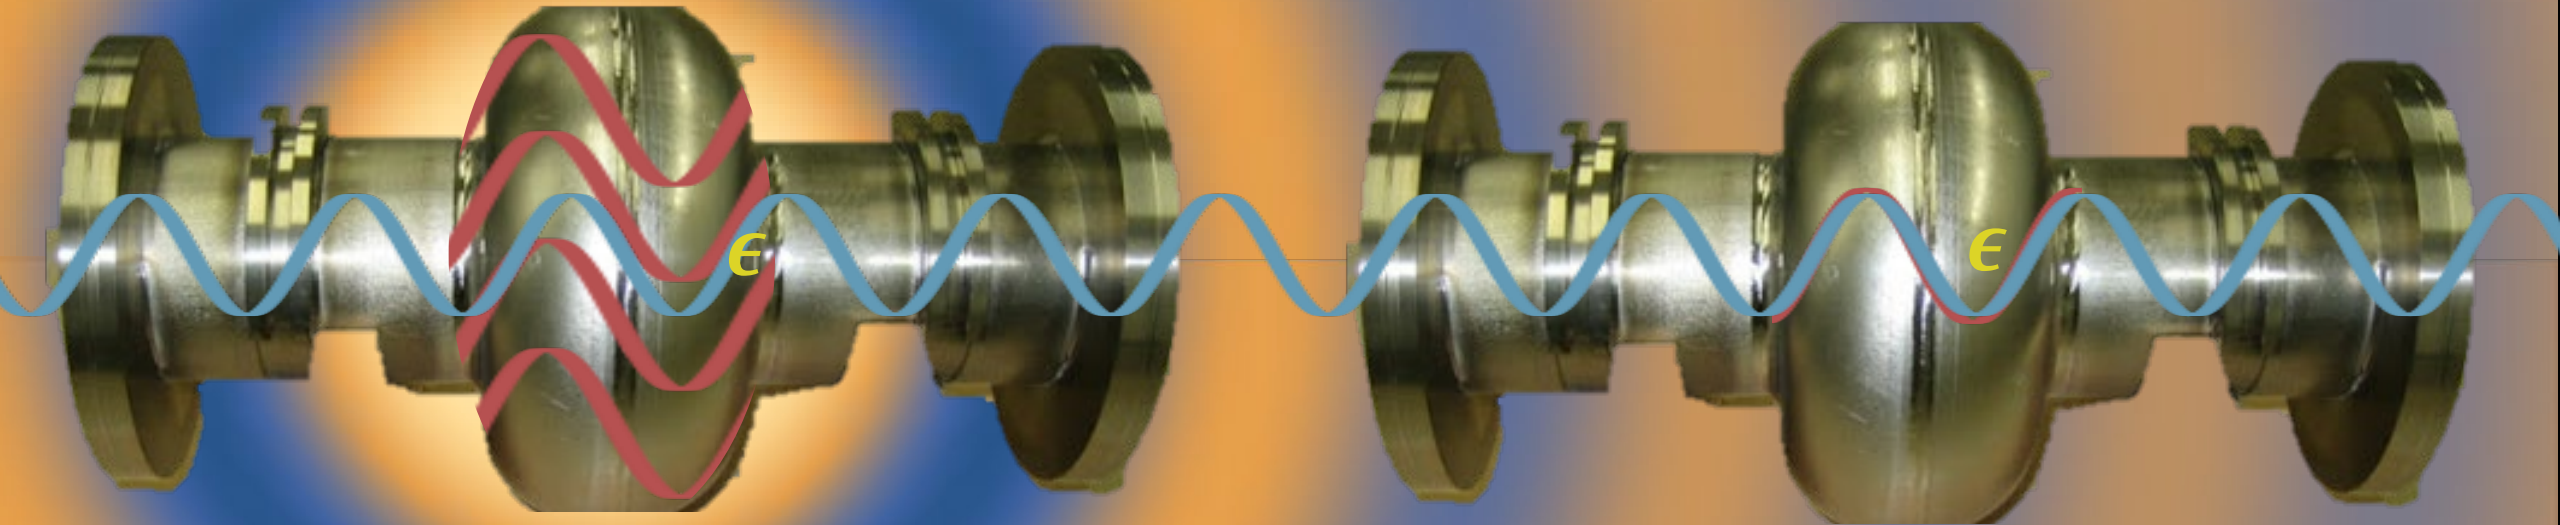

- Large fields
- High Quality

Superconducting Radio Frequency (SRF) cavity

*SRF  
Technology*

# SRF for Dark Photon

Power it up:

- 40 MV/m (26 J stored energy)
- $\sim 10^{25}$  photons

SM photon does not penetrate the superconducting wall.  
But dark photons can!

$$\vec{E}_{\text{receiver}}(\vec{r}, t) = -\frac{Q_{\text{rec}}}{\omega} \left[ \frac{\int d^3x \vec{E}_{\text{cav}}^*(\vec{x}) \cdot \vec{j}(\vec{x})}{\int d^3x |\vec{E}_{\text{cav}}(\vec{x})|^2} \right] \vec{E}_{\text{cav}}(\vec{r}) e^{i\omega t}$$

$$\vec{E}'(\vec{r}, t) \simeq -\epsilon m_{\gamma'}^2 \int_{V_{\text{emitter}}} d^3x \frac{\vec{E}_{\text{cav}}(\vec{x})}{4\pi|\vec{r}-\vec{x}|} e^{i(\omega t - k|\vec{r}-\vec{x}|)}$$

$$\vec{j}(\vec{r}) e^{i\omega t} = -\frac{i\epsilon}{\omega} \left( m_{\gamma'}^2 \vec{E}' - \vec{\nabla}(\vec{\nabla} \cdot \vec{E}') \right)$$

Isolated receiver

- High Q of  $10^{10}$  (accumulate tiny signal power)

# SRF for Dark Photon: naïve parametrics

Signal Strength (stored energy) then should be proportional to ( $m_{\gamma'} < \omega$ )

$$S \propto \frac{m_{\gamma'}^4}{\omega^4} \epsilon^4 Q_{receiver} Q_{emitter} P_{emitter} |G|^2$$

Background noise should be proportional to. e.g., thermal dominance

$$B \propto \text{Temperature}$$

Background fluctuation controlled at

$$\Delta B \propto \text{Temperature} \sqrt{\frac{t_{\text{rungup}}}{t_{\text{integration}}}}$$

Background noise also received contribution from possible cross-talks:

$$B \propto P_{emitter}$$

$$t_{\text{rungup}} = \frac{Q}{\omega} \sim 1 \text{ sec}$$

# Real Cavity Configuration

Real geometry:  
high gradient

$$\vec{E}_{\text{receiver}}(\vec{r}, t) = -\frac{Q_{\text{rec}}}{\omega} \left[ \frac{\int d^3x \vec{E}_{\text{cav}}^*(\vec{x}) \cdot \vec{j}(\vec{x})}{\int d^3x |\vec{E}_{\text{cav}}(\vec{x})|^2} \right] \vec{E}_{\text{cav}}(\vec{r}) e^{i\omega t}$$

E field strength

E Gradient Flow

Hidden Photon field  
highly oscillatory  
(numerical stability)

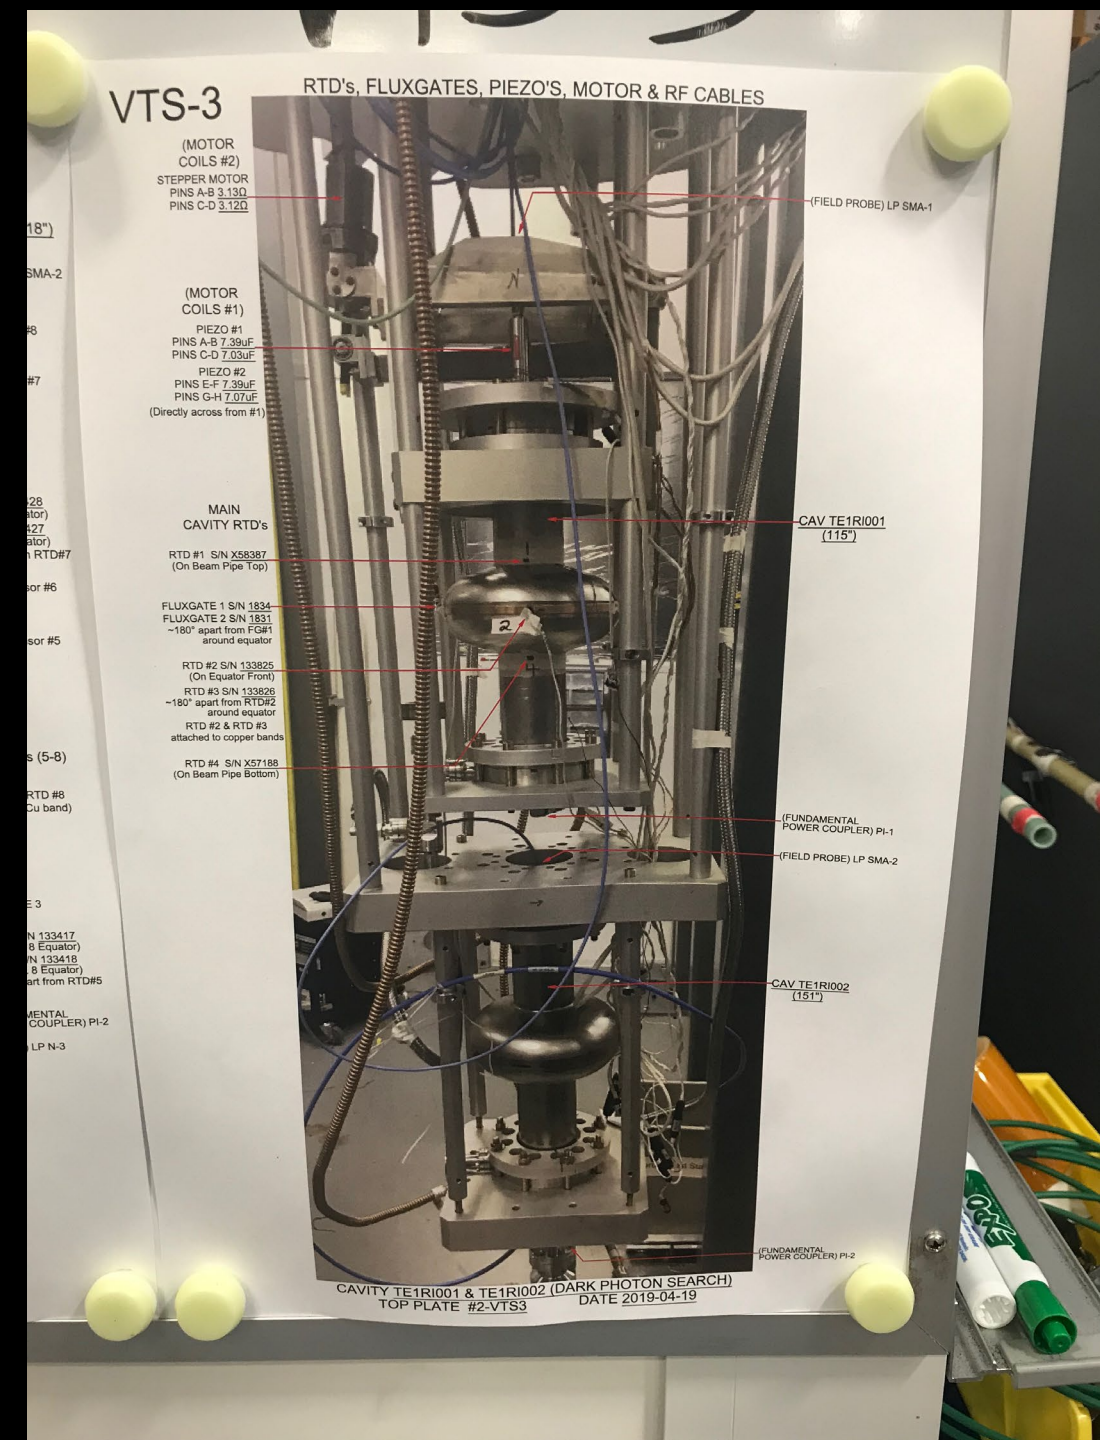

$$|G|^2 \equiv \frac{1}{\epsilon^4} \left( \frac{\omega}{m_{\gamma'}} \right)^4 \left[ \frac{\int d^3x \vec{E}_{\text{cav}}^*(\vec{x}) \cdot \vec{j}(\vec{x})}{\omega \int d^3x |\vec{E}_{\text{cav}}(\vec{x})|^2} \right]^2$$

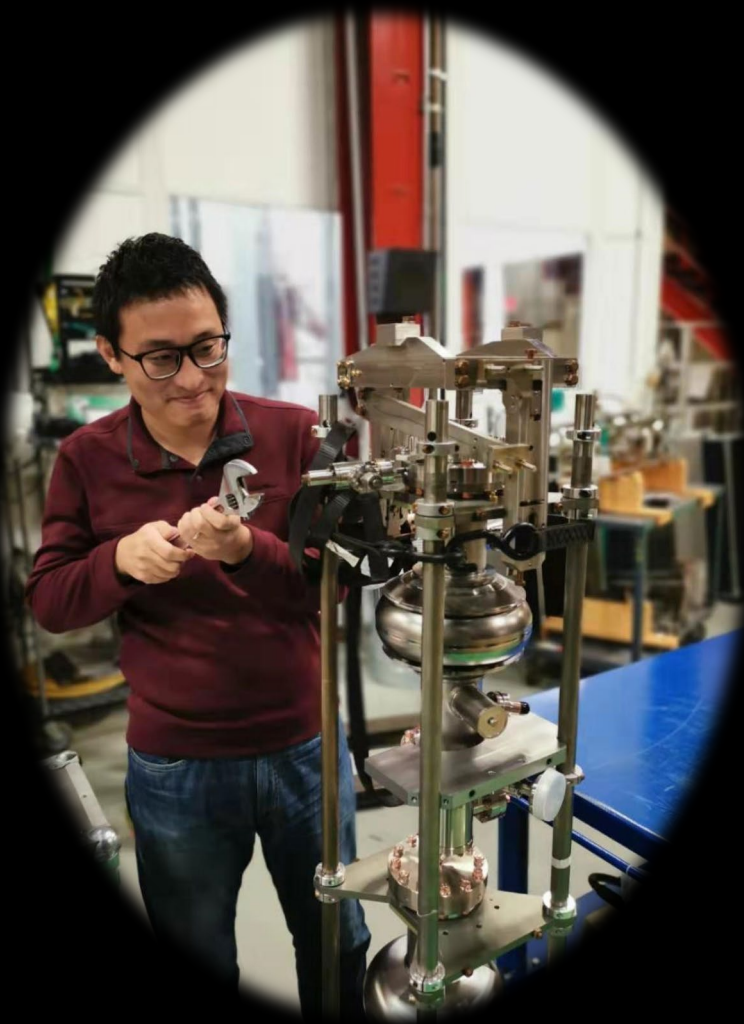

# Dark SRF Pathfinder Runs

# Pathfinder run(s) summary

It works!

- ✓ Design
- ✓ Tuner operation
- ✓ Microwave scheme for matching the frequencies
- ✓ Actual data – first acquisition

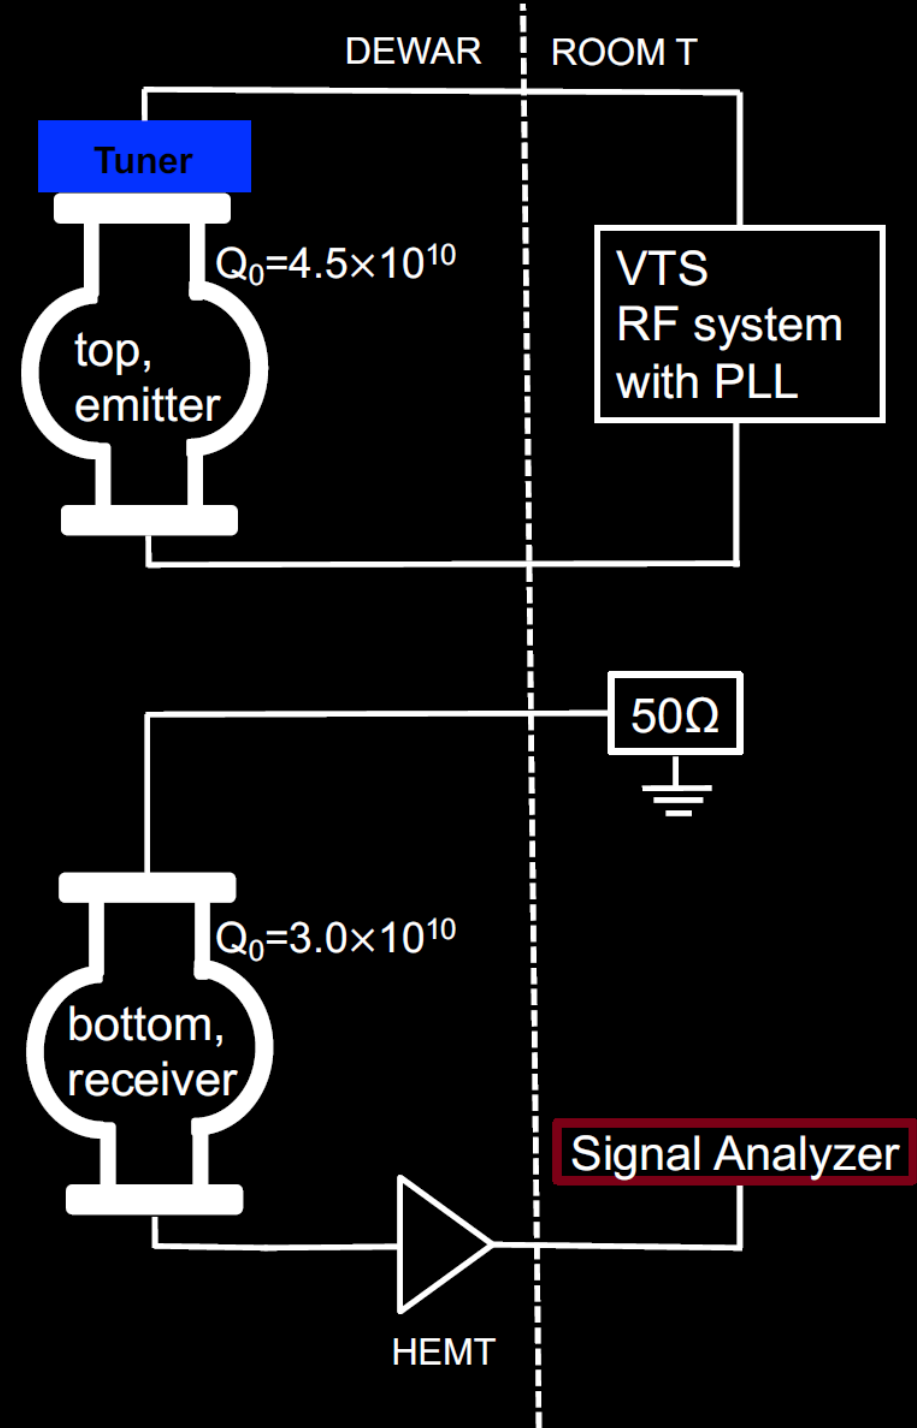

Zhen Liu (UMN)

Dark SRF & Beyond

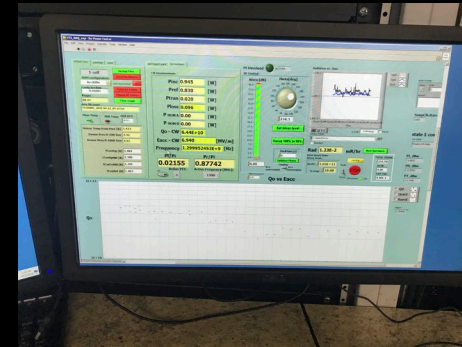

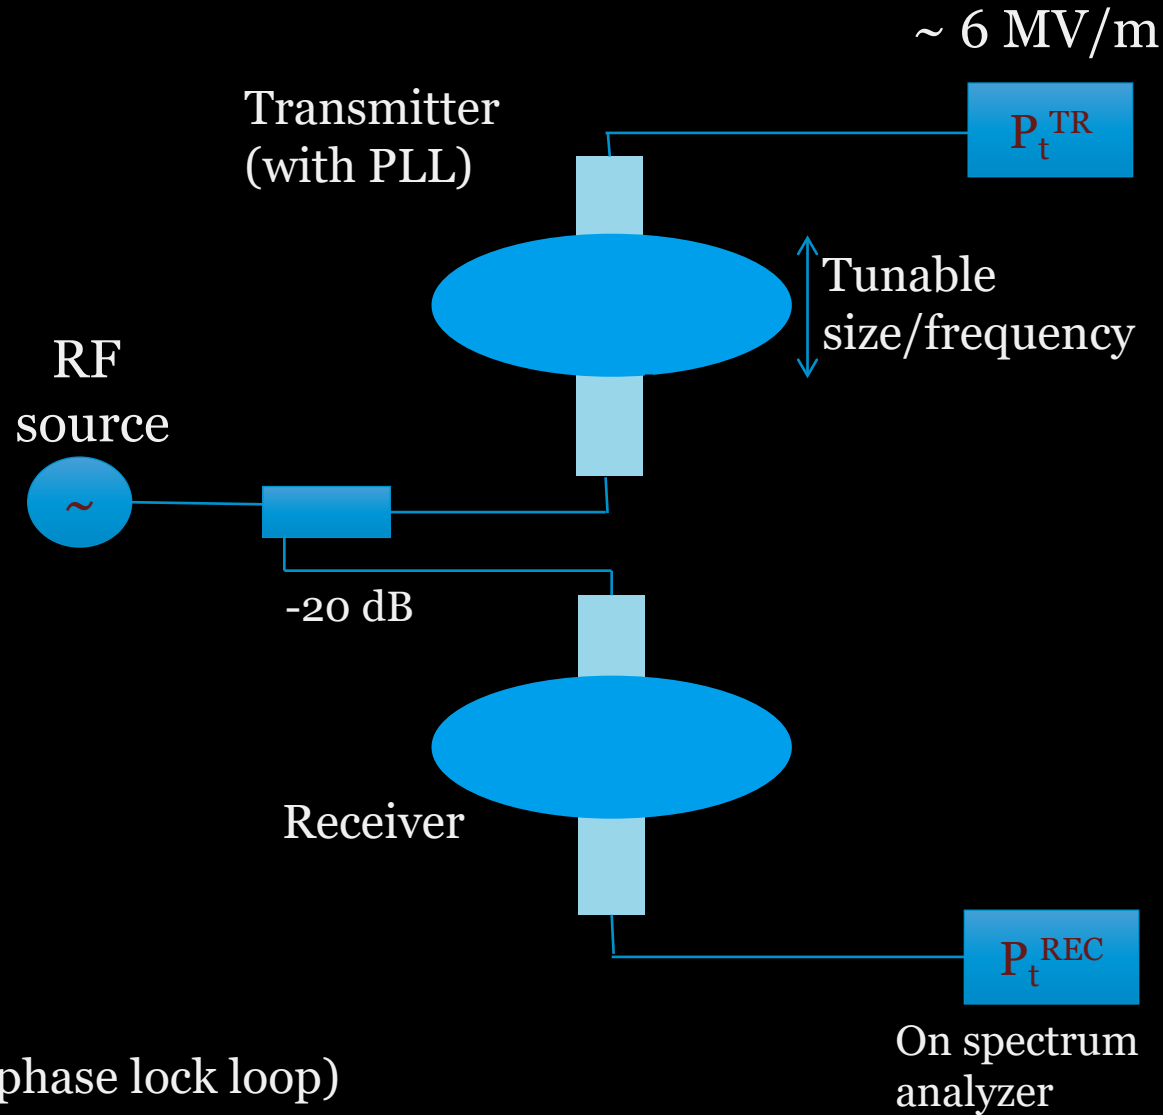

Winter Aspen 2023

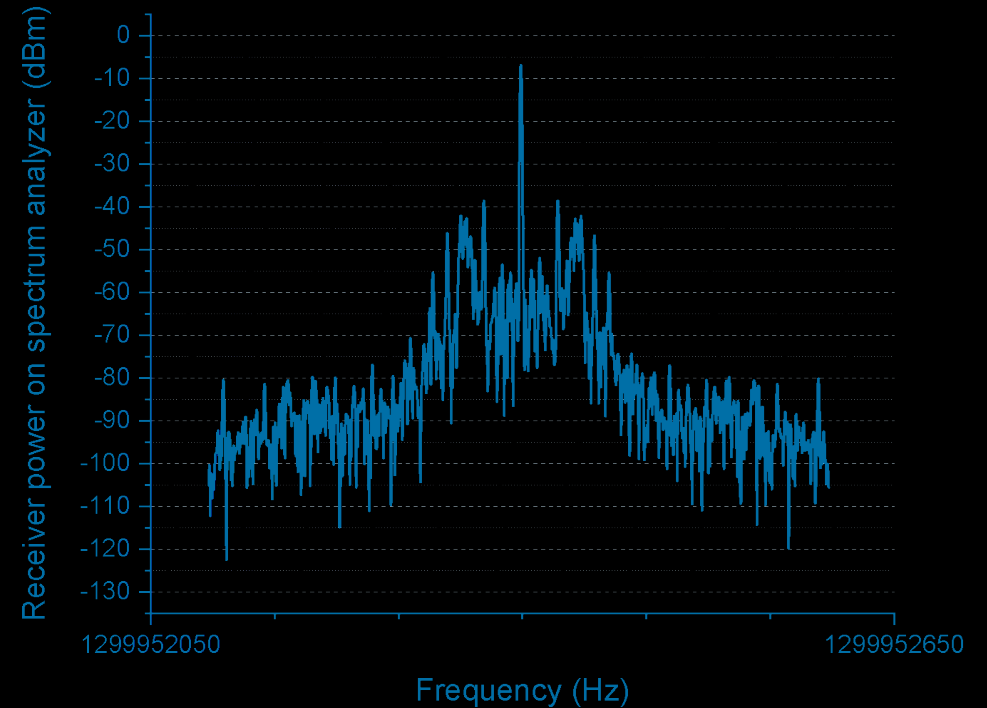

# 2019 Run pictures

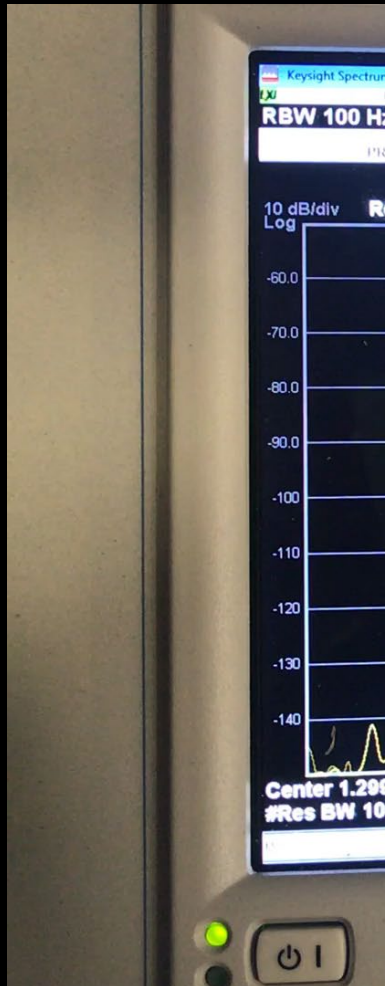

# Cavity frequency matching – Step 1

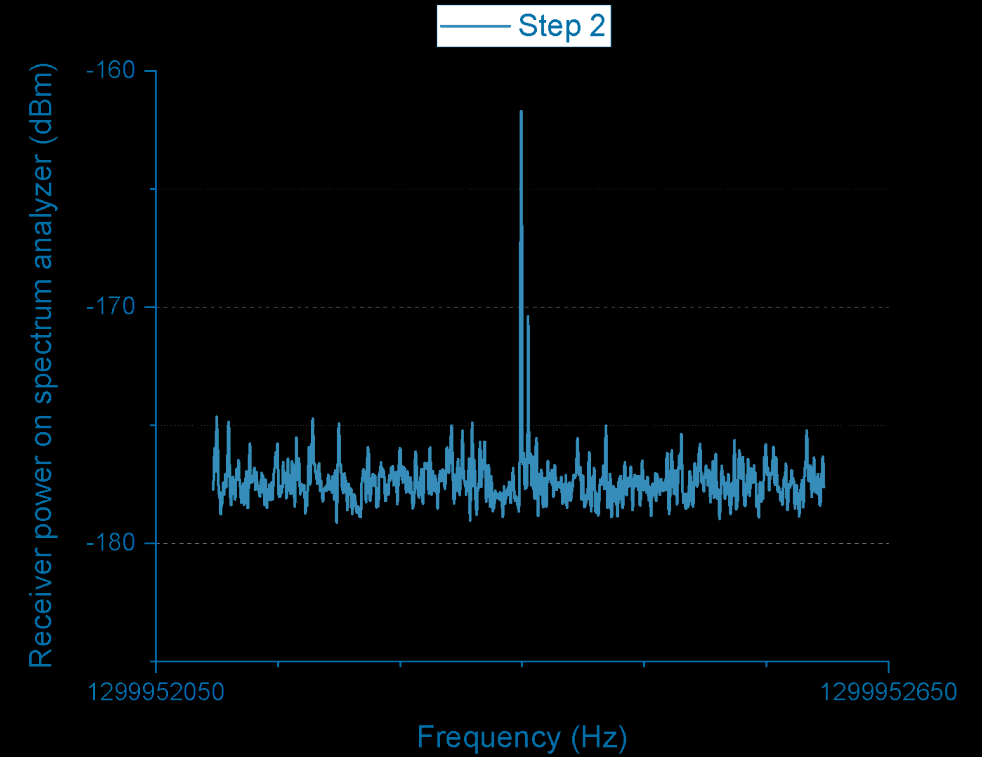

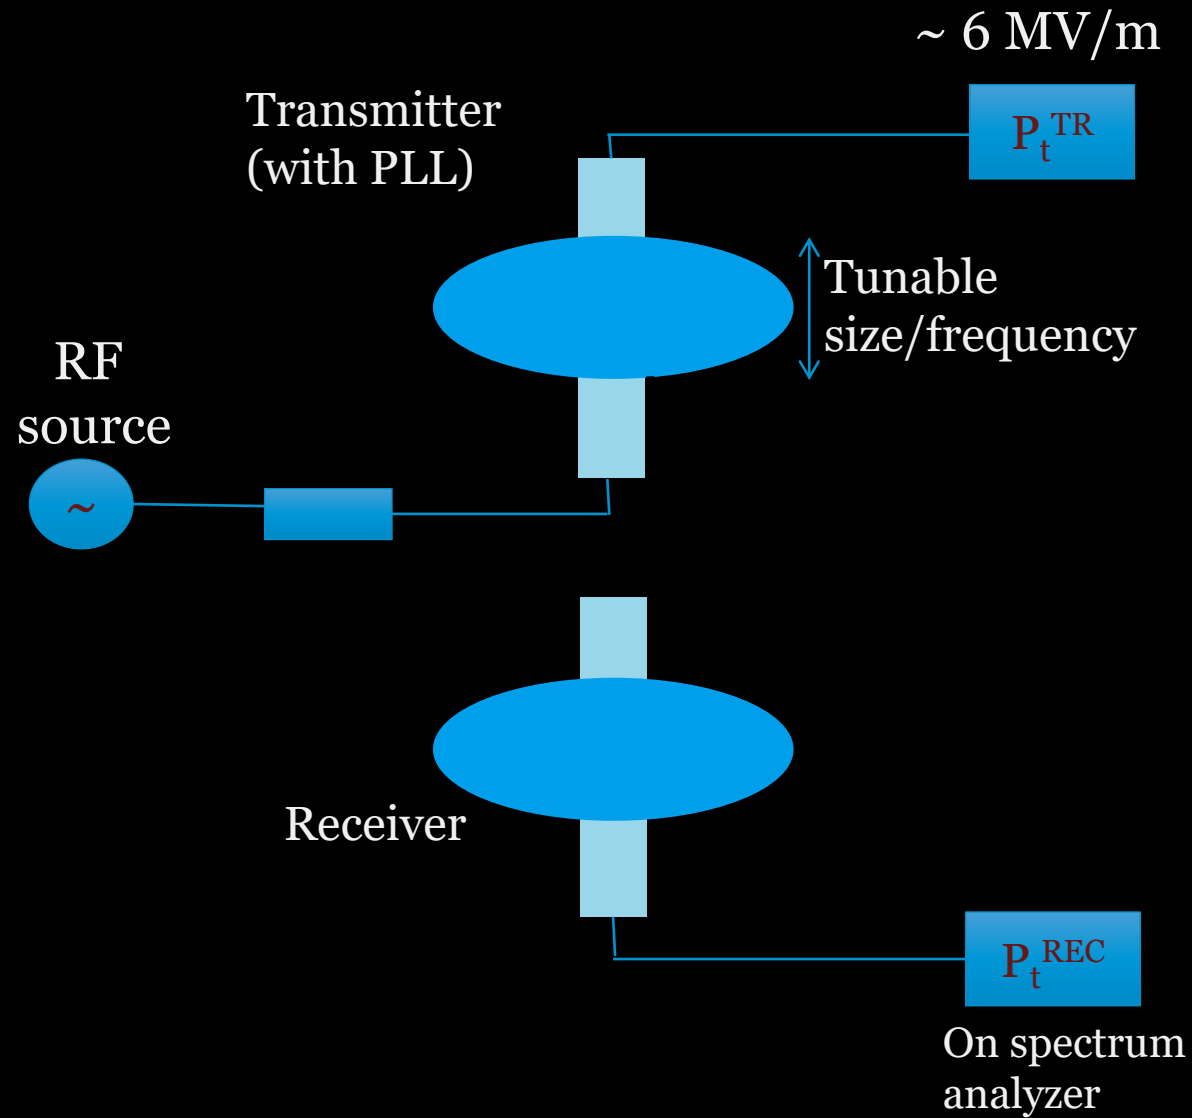

From now on, most measurement are shown in dBm ( $\text{dB } 10\log(x)$ ,  $\text{dBm} = 10\log(x/\text{mW})$ .) Note that we are always in dB-space,  $3\text{ dB} = \text{factor of } 2 \text{ in linear space}$ .

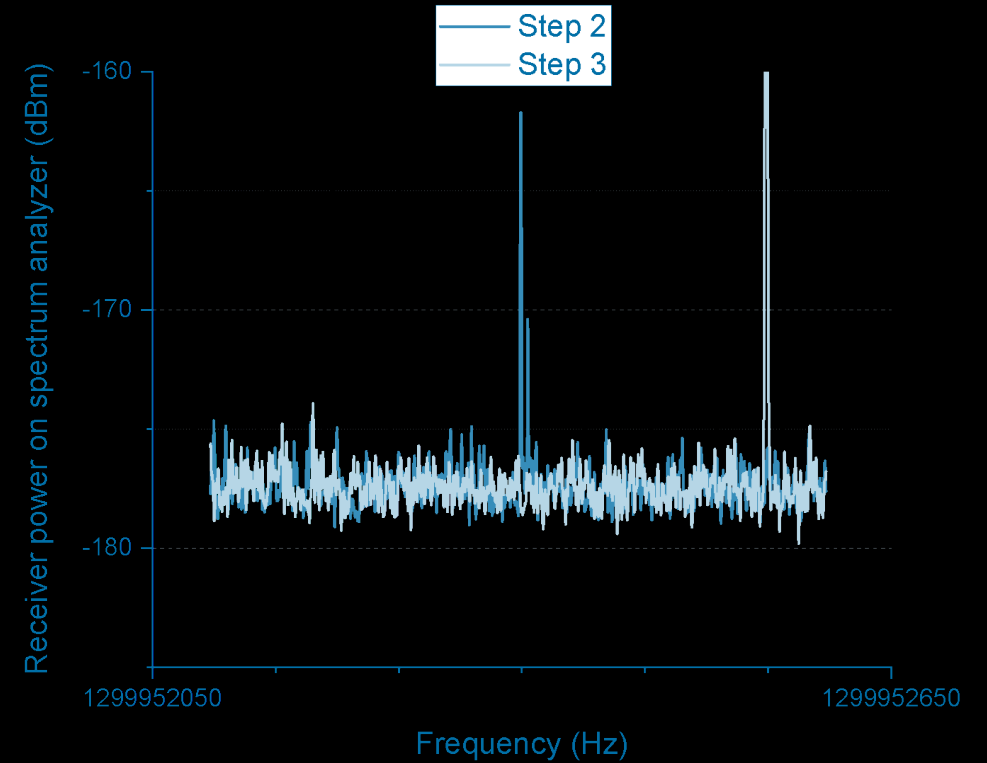

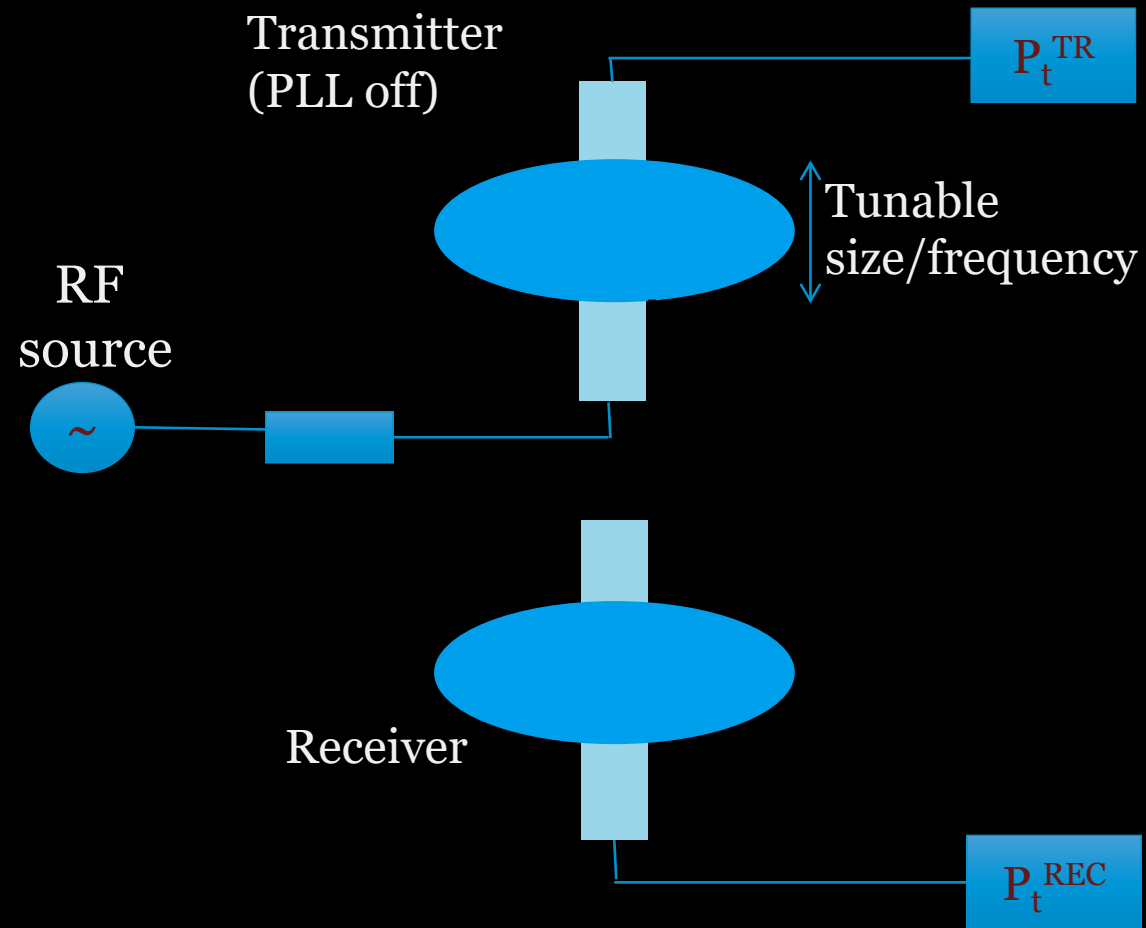

# Frequency matching

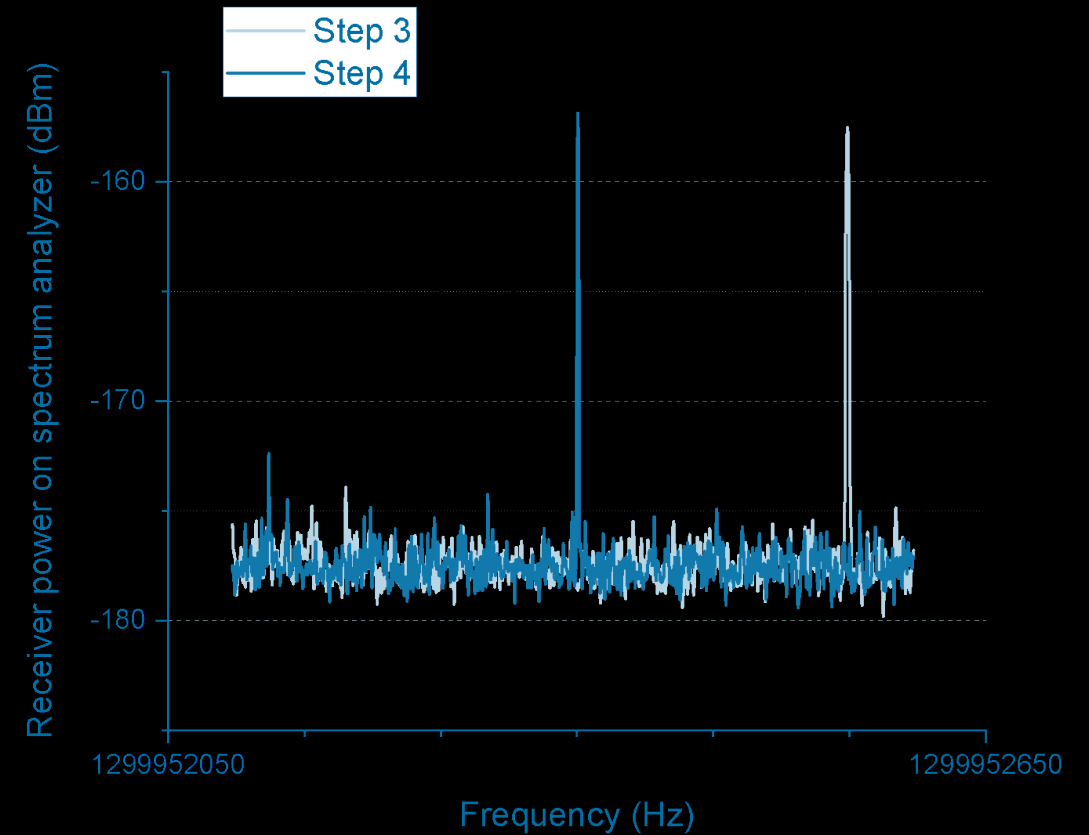

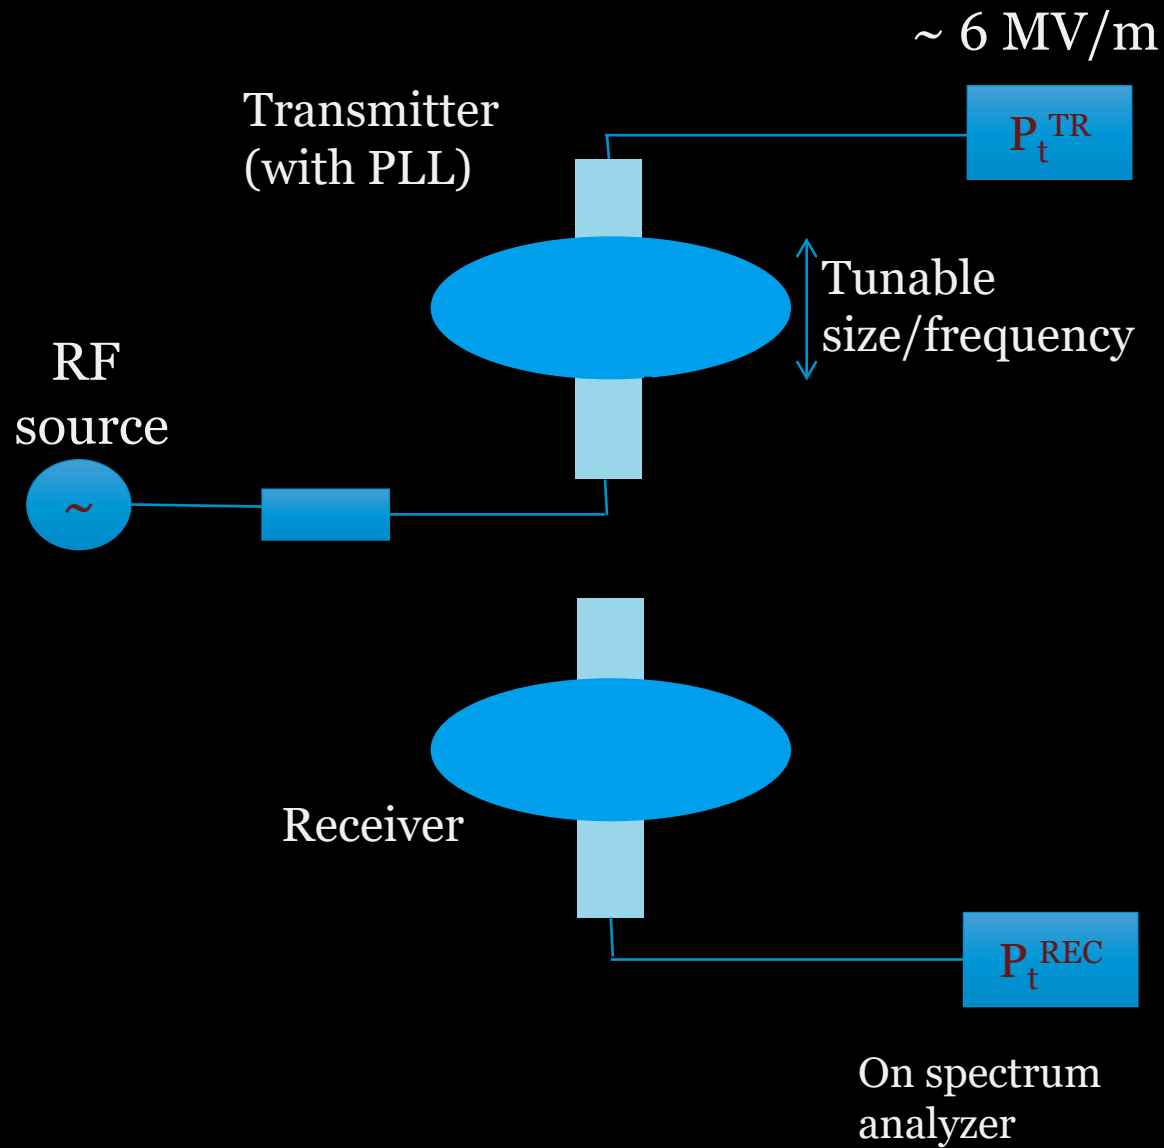

# Dark Photon search! – (Step 2)

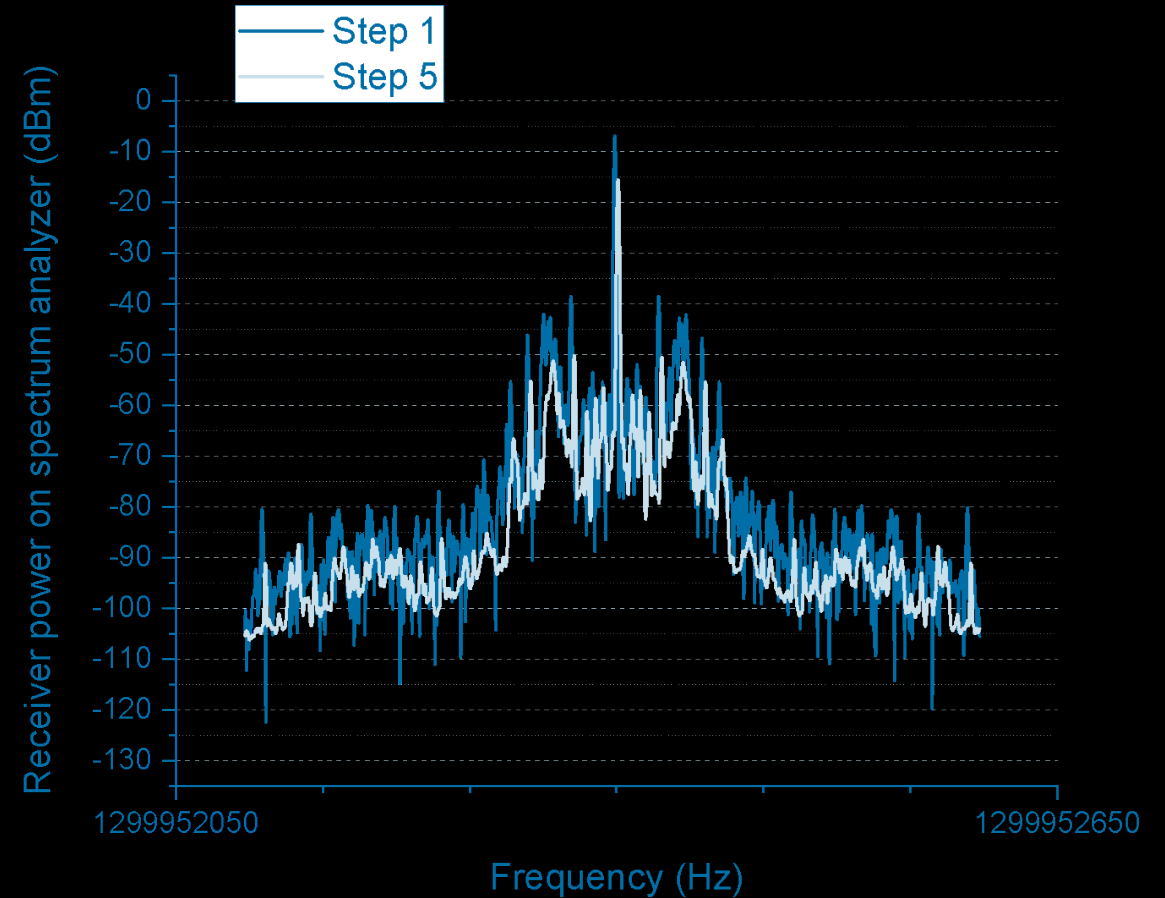

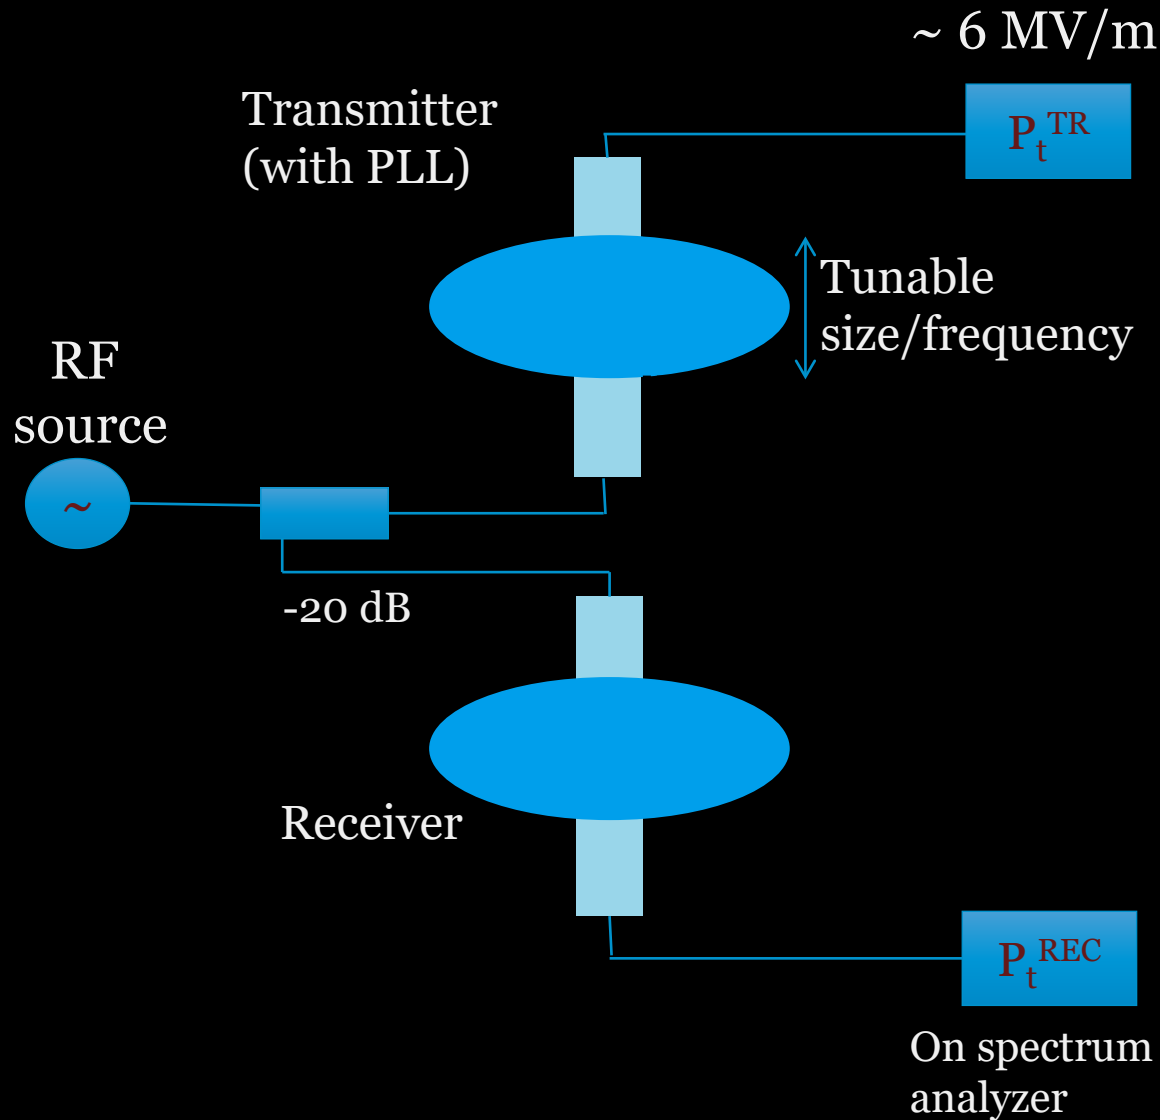

# Cross-talk check - Step 3

# Back to dark photon search - Step 4 = Step 2

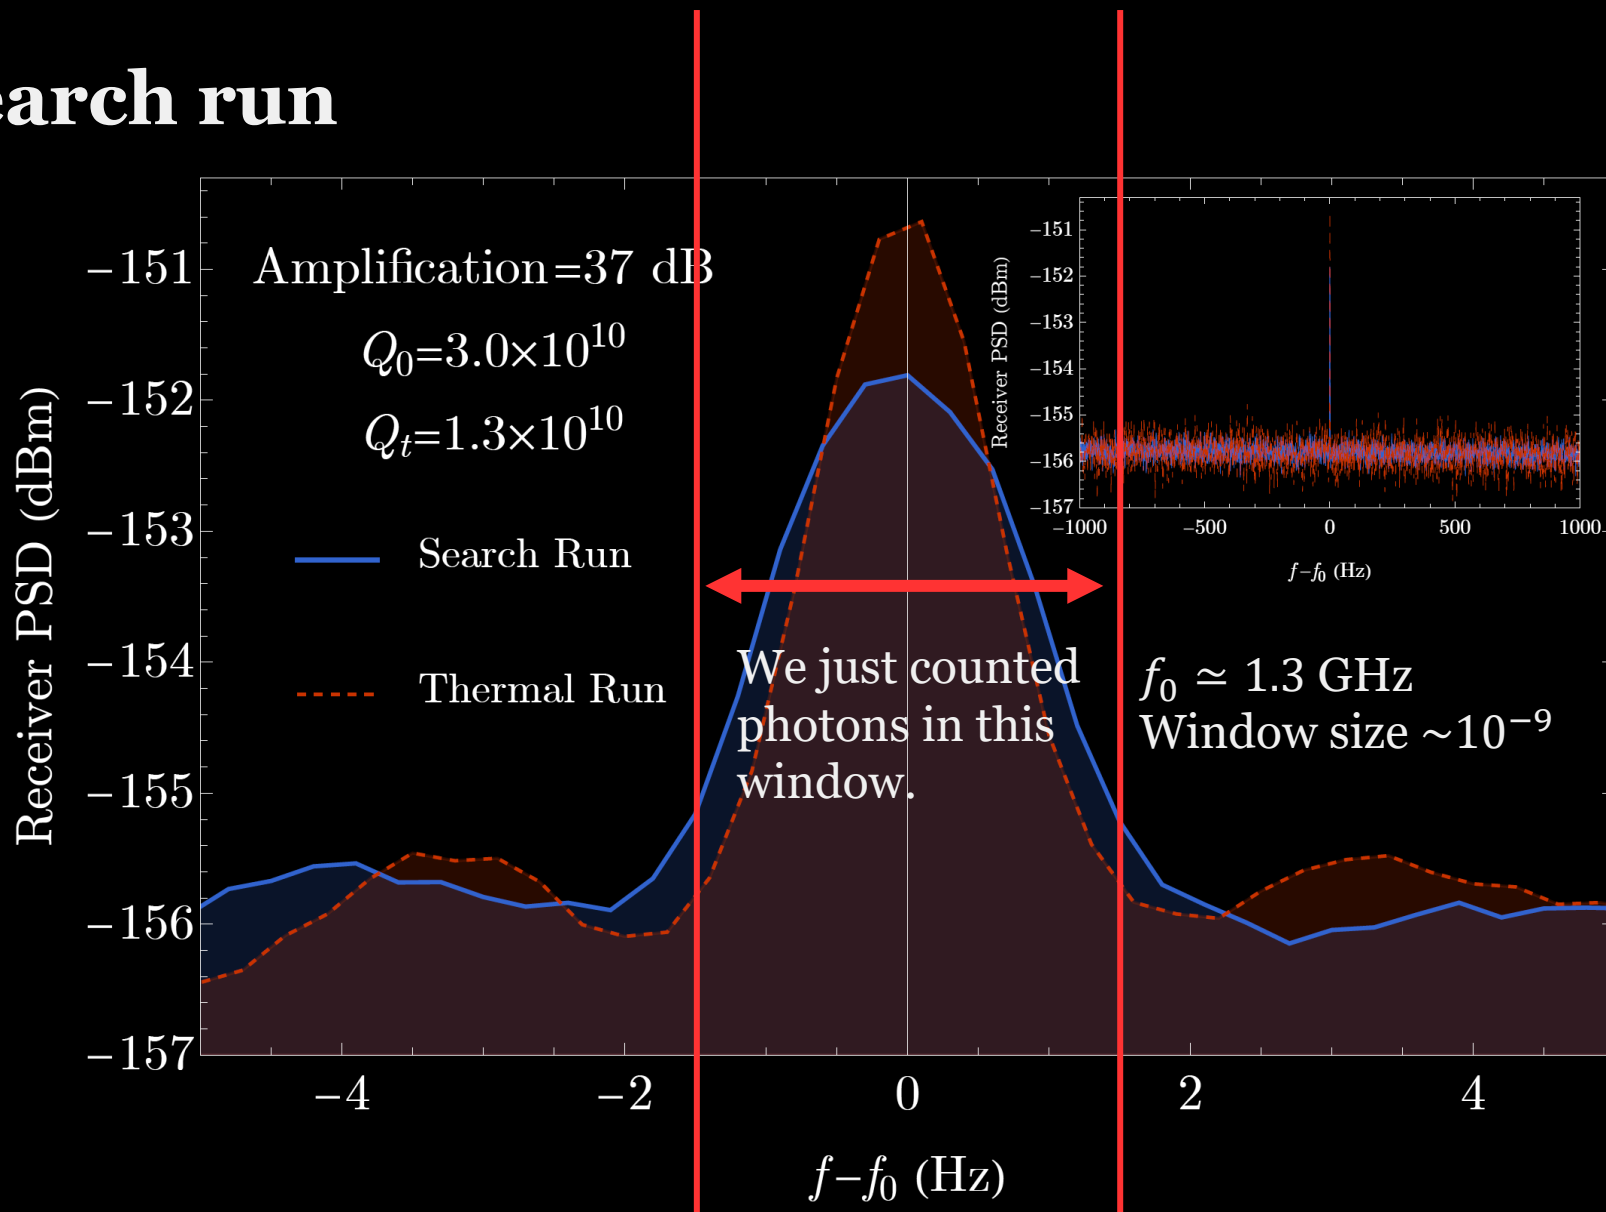

# Back to Step 5 = Step 1 – all in tune

# Measurements and Results

# Thermal run v.s. Search run

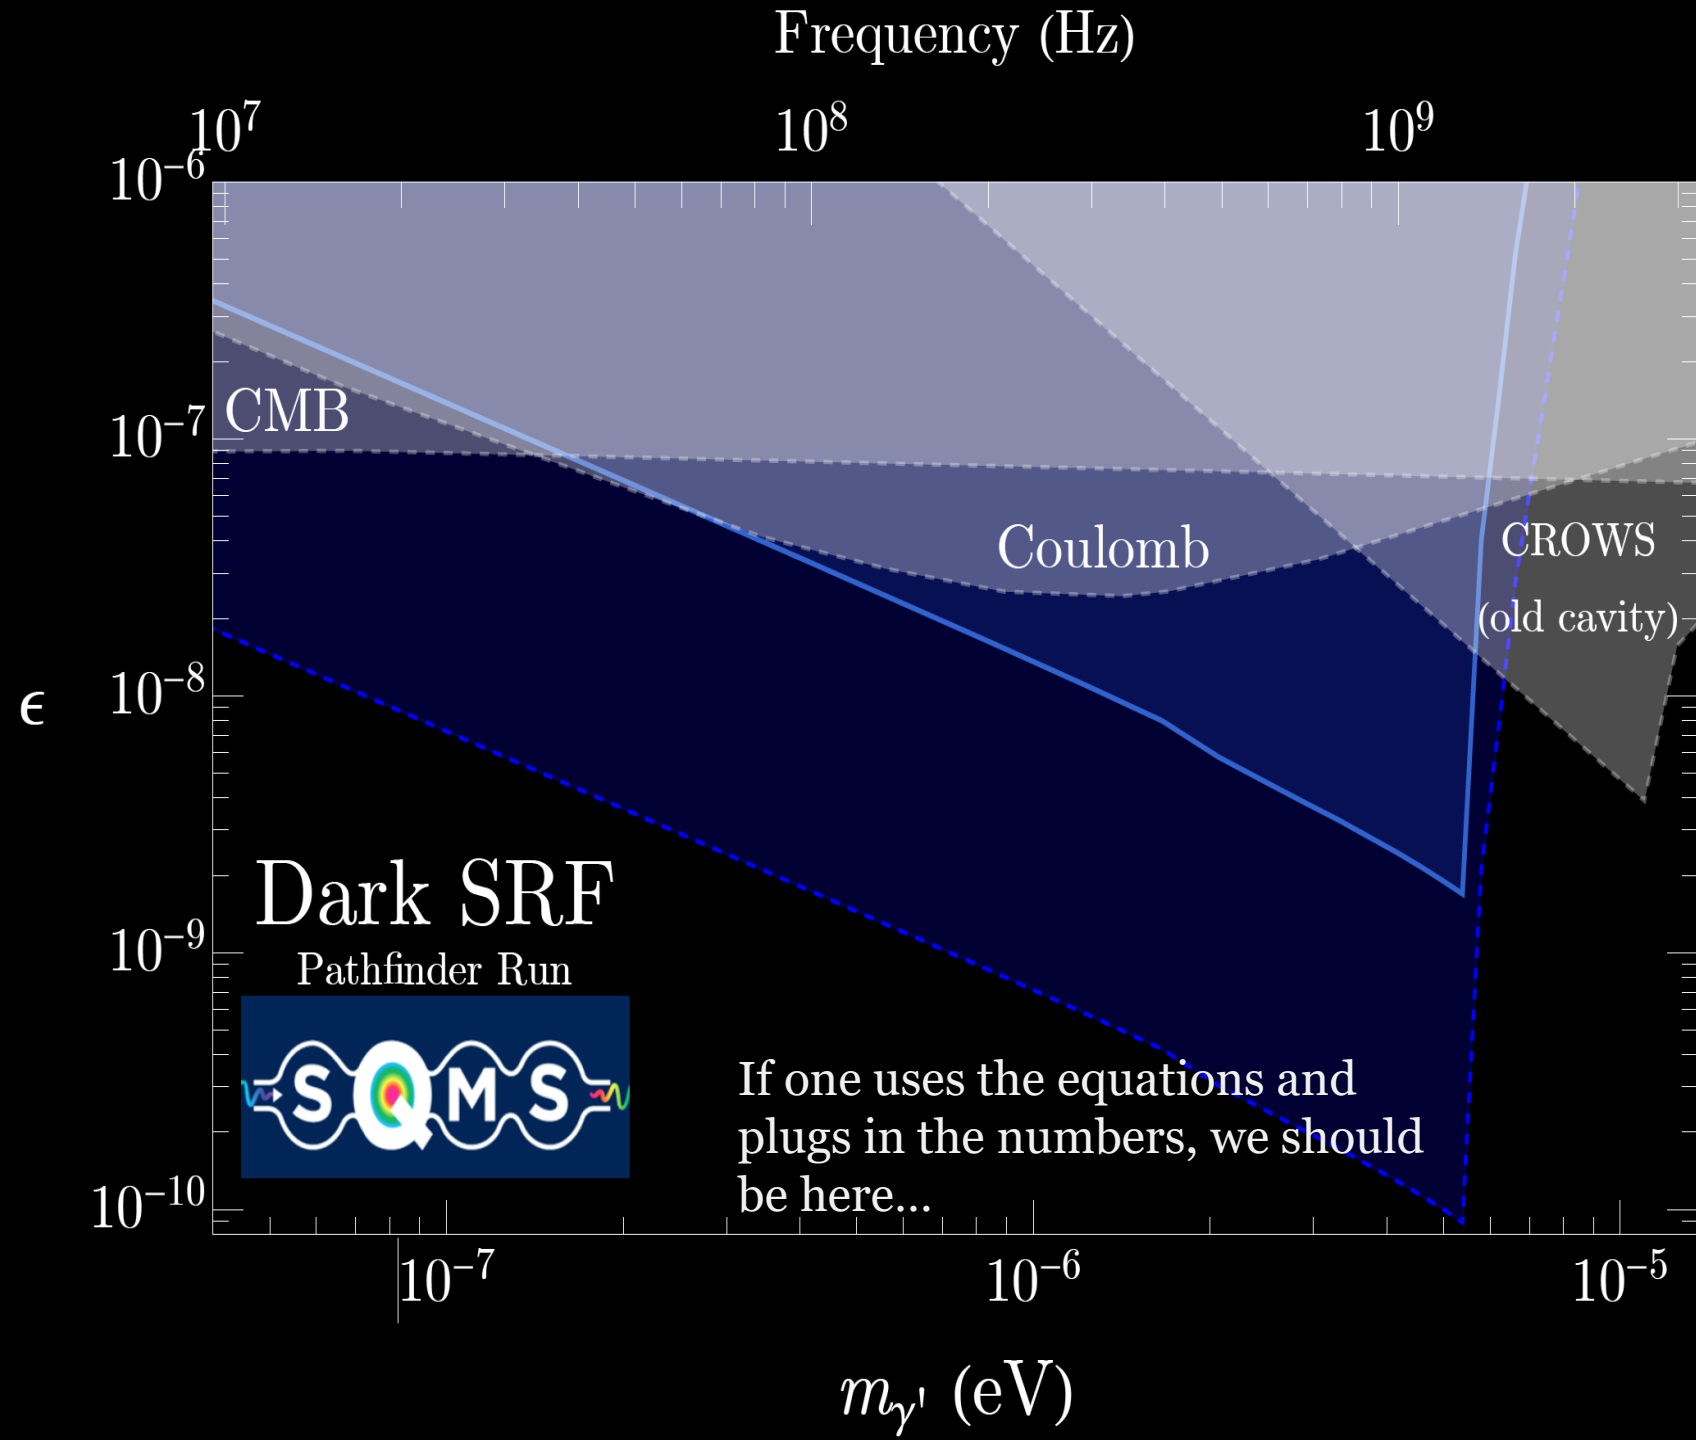

- Blue: Search run
    - $-151.8^{+0.16}_{-0.17}$  dBm
  - Red: Thermal run
    - $-151.6^{+0.23}_{-0.25}$  dBm
- (uncertainty driven by the integration time)

# Exciting New Coverage

Our pathfinder run results already explore new territory in such a log-log space!

We've learned a lot about the system and published our first results and been developing many new future directions (as planned).

# High-Q not always a blessing

# I lied (oversimplified) quite a bit:

- High-Q is a double-sided sword
- Our pathfinder result did not benefit as  $Q^2$  that we initially wanted
  - We are in a different limit that has not been explored before:  $\frac{\omega}{Q} \ll \delta\omega$  (the sources I will highlight soon)
  - Post the end-of-2019 pathfinder search run, we had to perform many validations- and cross-check runs between 2020-2022

A GHz device can be stable in kHz-level ( $Q = 10^6$ ), but many of its properties are not stable at subHz-level ( $Q \geq 10^9$ ).

To get a physical sense,

Cavity size:  $\sim 20$  cm

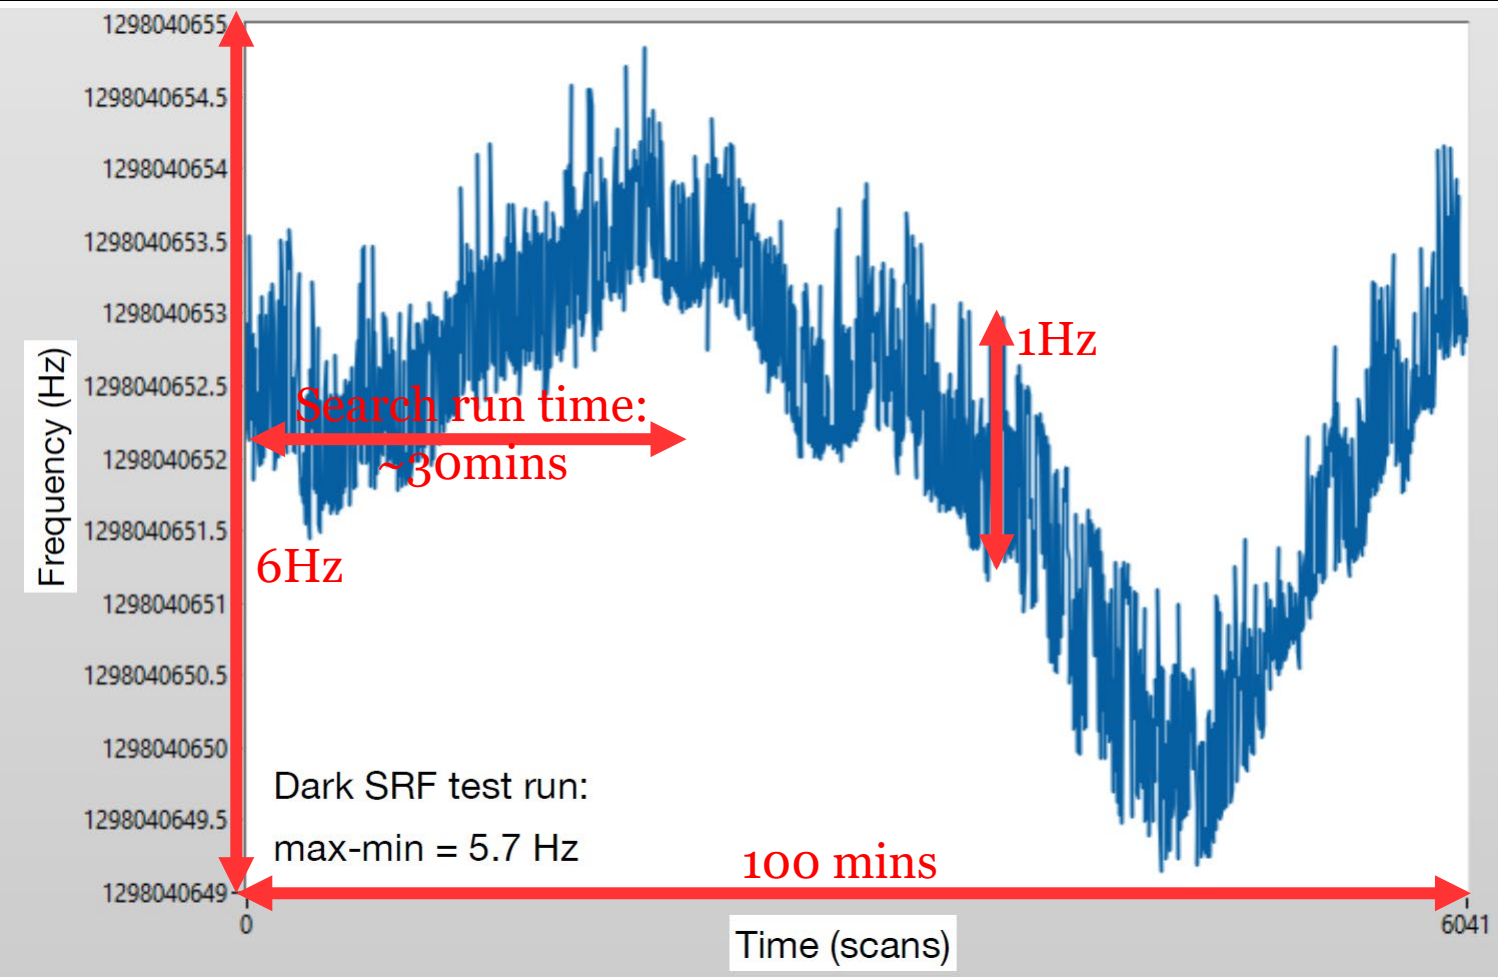

Quality factor:  $10^{10}$

Hence the line width: 0.13 Hz

For **Hz-level** stability, one needs to ensure the cavity size does not change at the **sub-nanometer** level.

Many sources contribute to instabilities: temperature, bubbles, pressure change at the surface, etc.

# Emitter cavity frequency stability

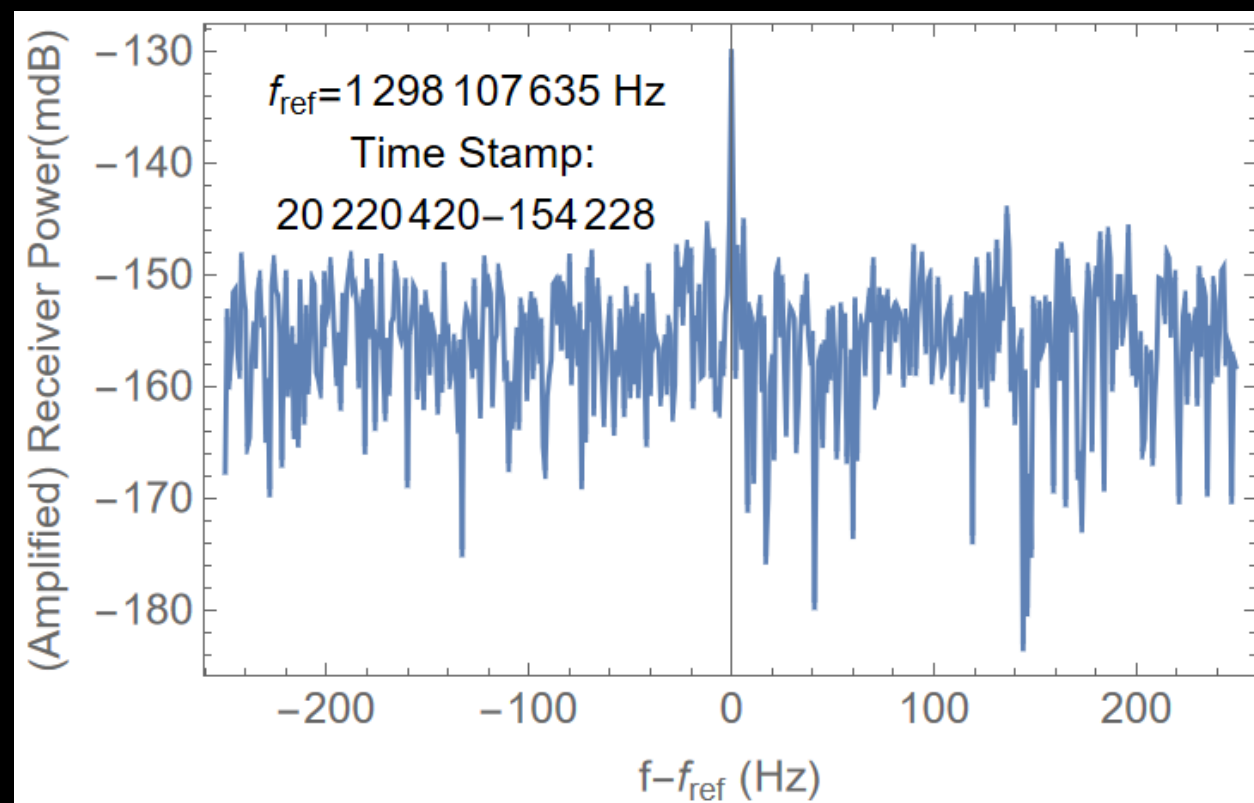

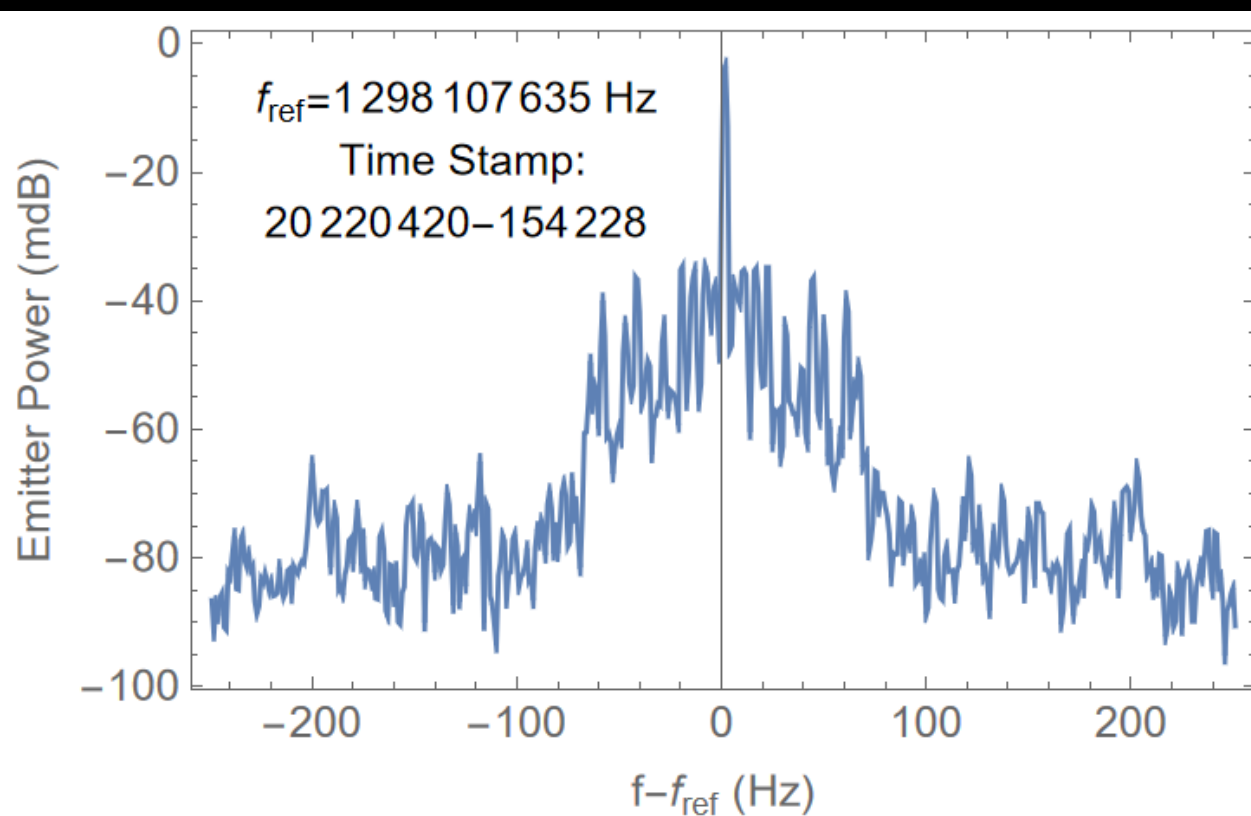

Dedicated frequency stability runs, two effects:

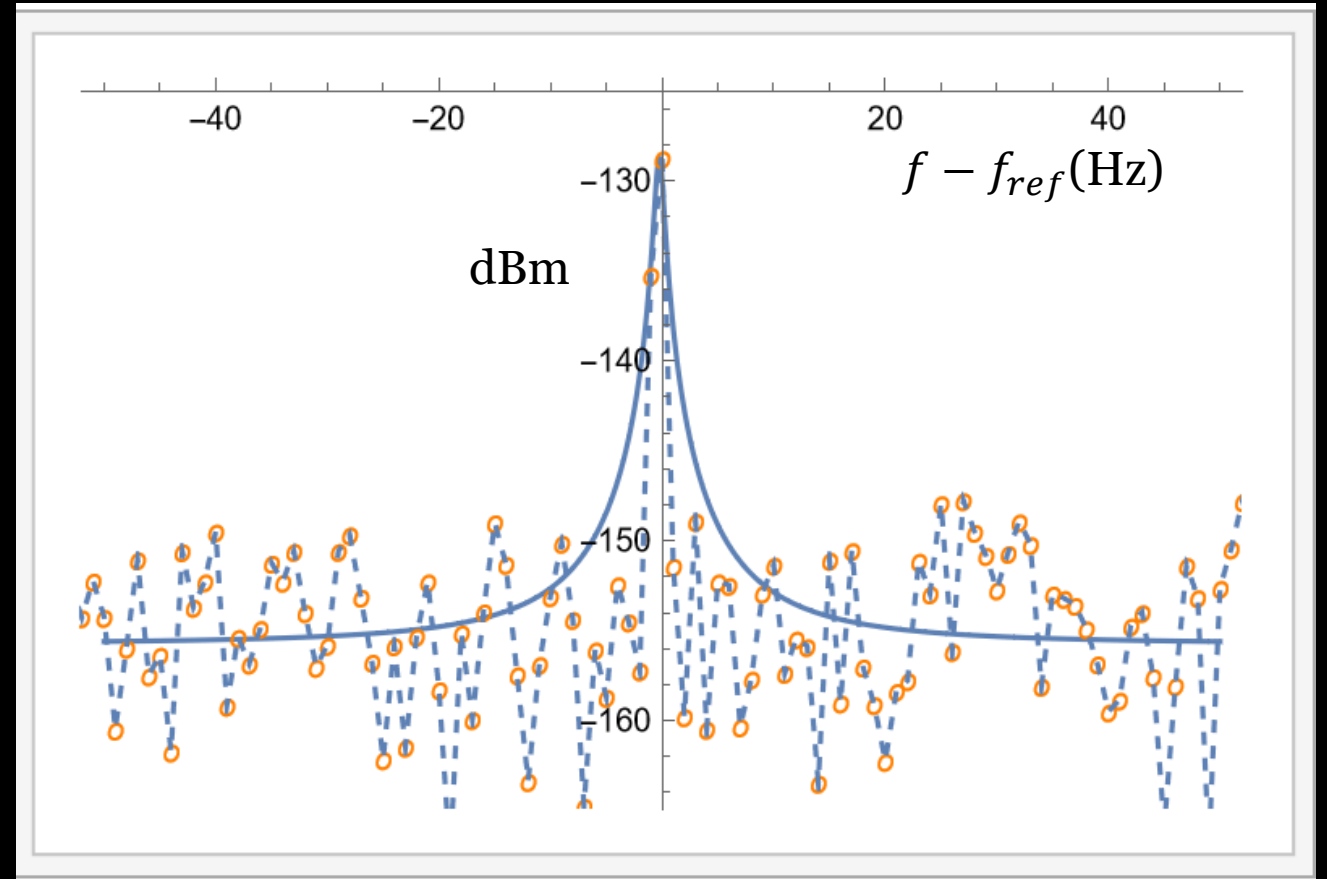

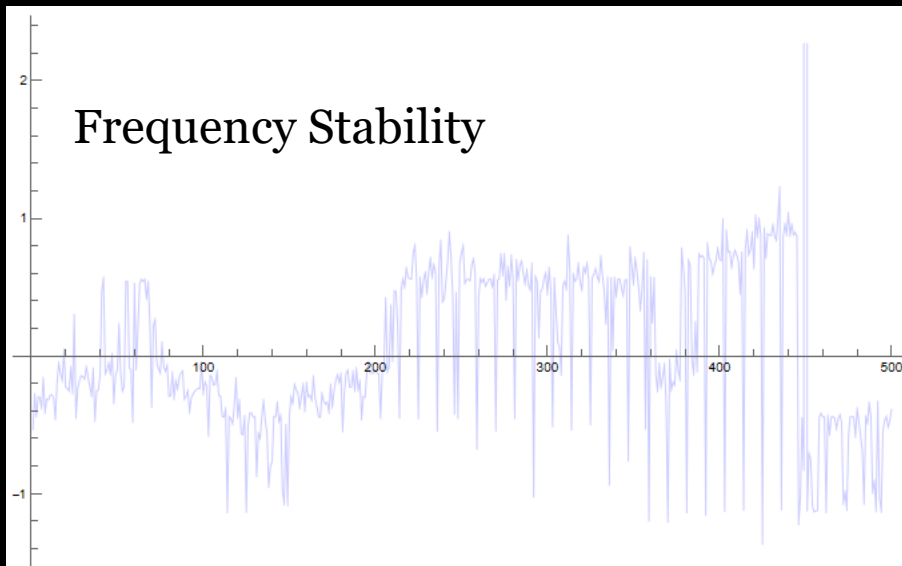

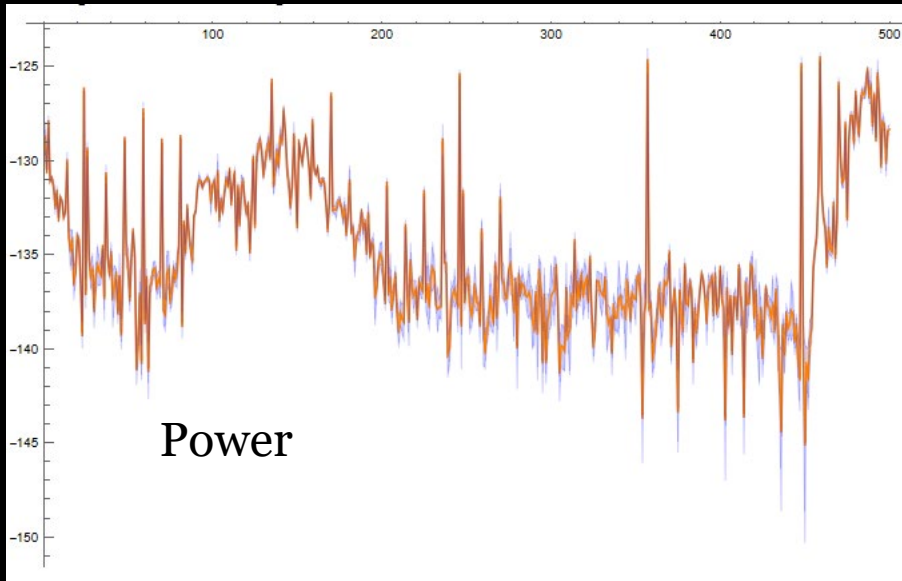

- Frequency drift
- Microphonics

Parameter	Emitter	Receiver
$Q_0$	$4.5 \times 10^{10}$	$3.0 \times 10^{10}$
$Q_{in}$	$1.8 \times 10^9$	$4.5 \times 10^{11}$
$Q_t$	$2.9 \times 10^{11}$	$1.3 \times 10^{10}$
freq. drift	5.7 Hz	3.0 Hz
microphonics	3.1 Hz	3.1 Hz

# The PSD of the Emitter and Receiver at a given moment

# Data Visualization and checks (receiver fit; validation run 19, 2022)

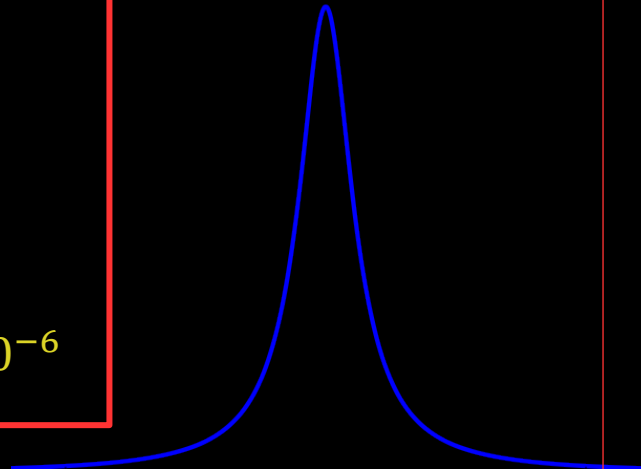

# We presented a very conservative limit

$$|G|^2 \equiv \frac{1}{\epsilon^4} \left( \frac{\omega}{m_{\gamma'}} \right)^4 \left[ \frac{\int d^3x \vec{E}_{\text{cav}}^*(\vec{x}) \cdot \vec{j}(\vec{x})}{\omega \int d^3x |\vec{E}_{\text{cav}}(\vec{x})|^2} \right]^2$$

$$|G|^2 \rightarrow \frac{\omega^2}{\omega^2 + 4\delta_\omega^2 Q_{\text{rec}}^2} |G|^2$$

$$\begin{aligned} & \frac{\omega^2}{\omega^2 + 4\delta_\omega^2 Q_{\text{rec}}^2} \\ & \rightarrow \frac{\left( \frac{\omega}{Q_{\text{rec}}} \right)^2}{\left( \frac{\omega}{Q_{\text{rec}}} \right)^2 + 4\delta_\omega^2} \\ & \rightarrow \frac{(\sim 0.04 \text{ Hz})^2}{(\sim 16 \text{ Hz})^2} \rightarrow 7 \times 10^{-6} \end{aligned}$$

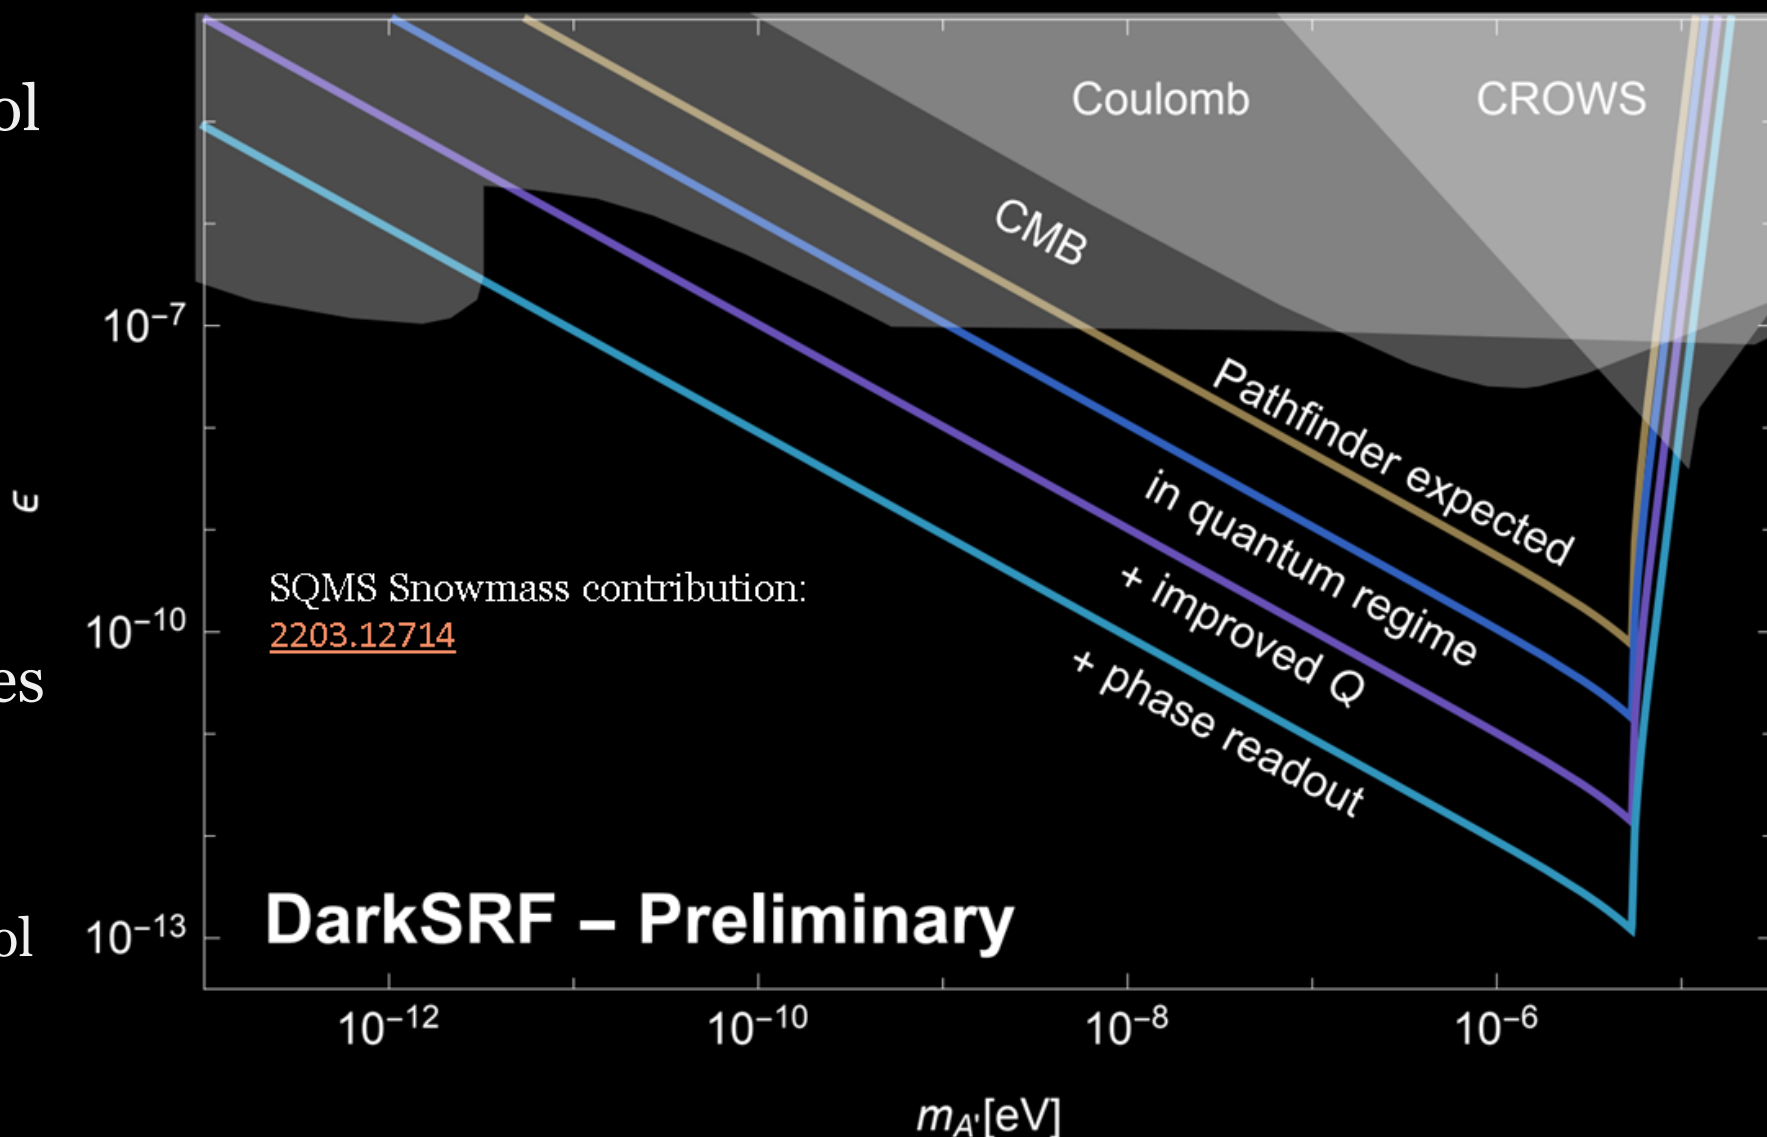

- Frequency drift took as a constant frequency **mismatch** at  $5.7 \text{ Hz} \oplus 3.0 \text{ Hz}$ 
  - These are drifts at 100 mins scale, our search is 30 mins scale;
  - One can live-monitor and take the data with no drifts.
- Microphonics modeled as constant frequency **mismatch** at  $3.1 \text{ Hz} \oplus 3.1 \text{ Hz}$ 
  - Theoretically, it is a much less suppression as it reduces effective integration time. (Working on proper modeling.)

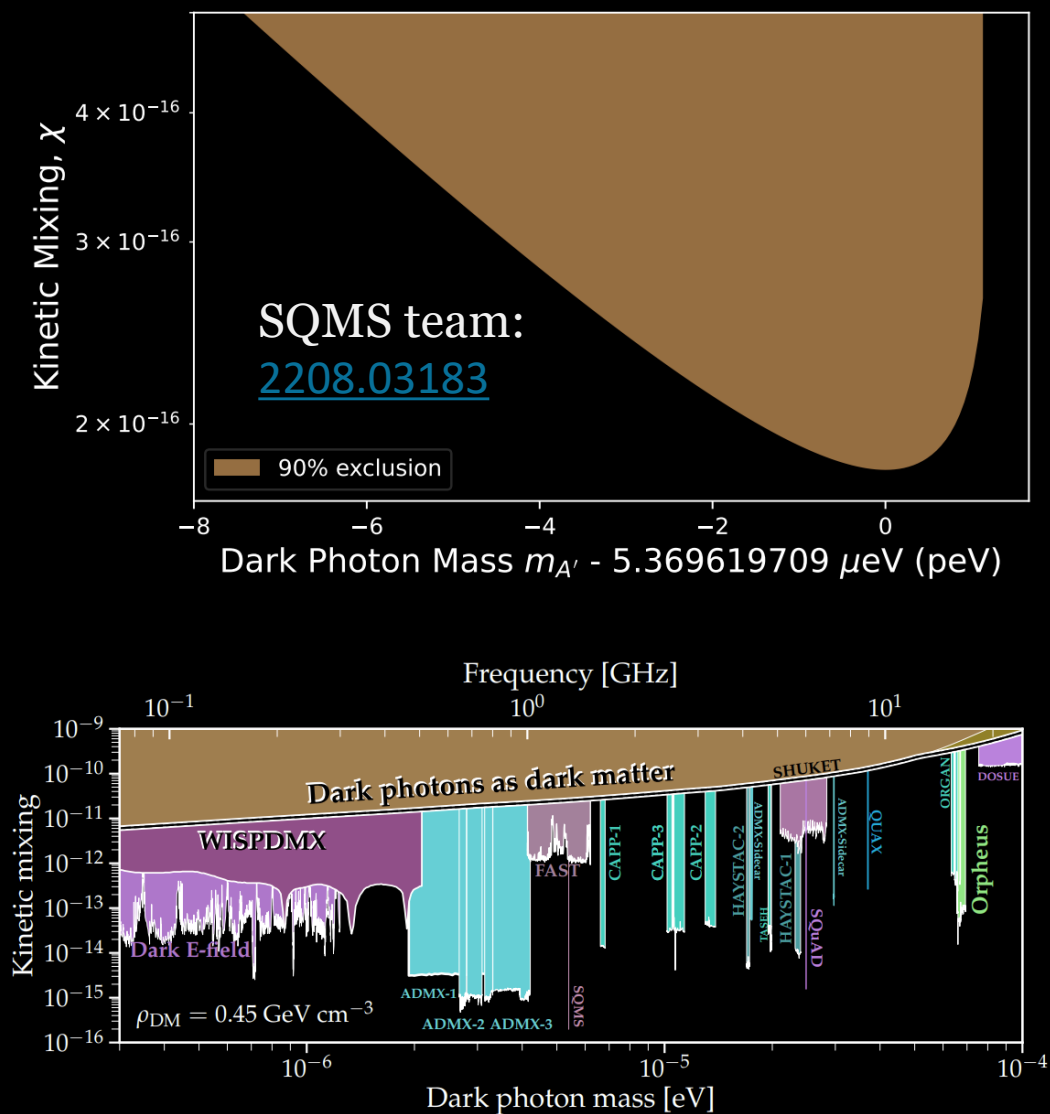

Essentially, modeled as searching off-resonance.

## Near (or far?) Future

- Improving noise isolation and control into few photon limits;
- Improve  $Q$  (seems require careful discussion)
- Phase-sensitive readout
- Off-the-shelf cavities  $\rightarrow$  better designed and treated ones
  - New design
  - New search protocol

# Other and related activities

- Dark photon DM search;
- Axion LSW validation and search;
  - Single cavity design
  - Double cavity multi-mode design
  - Double cavity plus conversion region design
- Axion DM search;
- Gravity Wave validation and search;
- Millicharged particle search;
- Photon mass constraints;
- ...

See many recent studies, and also partial summaries in SQMS SRF paper: [2203.12714](#)

# Outlook

- Fun journey to arrive at a first result using SRF cavities for HEP searches in the Dark SRF pathfinder run.
  - Covered new parameter regions in the log-log space;
  - Learnt & learning to handle ultrahigh Q opportunities;
  - Establishing and developing schemes for robust tests;
- An active program ahead:
  - Many planned steps improve the results significantly;
  - Many possible theory research directions to improve the results & treatments (interested parties highly welcome!);
  - Many “adjacent” exploration and searches possible;

Thank you!  
& the fantastic Dark SRF team!
