# Theory Overview of Charged Lepton Flavor Violation in Heavy Particle Decays

Wolfgang Altmannshofer (UCSC)

waltmann@ucsc.edu

mainly based on Whitepaper 2205.10576 with:

Cecile Caillol (CERN), Mogens Dam (NBI), Stefania Xella (NBI), Yongchao Zhang (Nanjing)

Snowmass Summer Meeting 2022, Seattle, July 17 - 26, 2022

► In the SM, lepton flavor violating decays of the Z, Higgs, and top are suppressed by the tiny neutrino mass splittings

e.g. 
$$BR(Z \to \mu e) \sim BR(Z \to \mu \mu) \left| \frac{g^2}{16\pi^2} \frac{m_{\nu}^2}{m_W^2} \right|^2 \sim 10^{-50}$$

Any observation in the foreseeable future would be an unambiguous sign of new physics.

## Comparision with Low Energy Probes

 Consider LFV decays of the Z boson, the Higgs, the top in the presence of generic New Physics

$$\frac{\mathsf{BR}(Z \to \mu e)}{\mathsf{BR}(Z \to \mu \mu)} \sim g_{\mathsf{NP}}^{2} \left(\frac{v}{\Lambda_{\mathsf{NP}}}\right)^{4} , \qquad \frac{\mathsf{BR}(H \to \tau \mu)}{\mathsf{BR}(H \to \tau \tau)} \sim g_{\mathsf{NP}}^{2} \left(\frac{v}{\Lambda_{\mathsf{NP}}}\right)^{4} \\ \frac{\mathsf{BR}(t \to c \mu e)}{\mathsf{BR}(t \to W b)} \sim \frac{g_{\mathsf{NP}}^{2}}{\mathsf{16}\pi^{2}} \left(\frac{v}{\Lambda_{\mathsf{NP}}}\right)^{4}$$

## Comparision with Low Energy Probes

 Consider LFV decays of the Z boson, the Higgs, the top in the presence of generic New Physics

$$\frac{\mathsf{BR}(Z \to \mu e)}{\mathsf{BR}(Z \to \mu \mu)} \sim g_{\mathsf{NP}}^{2} \left(\frac{v}{\Lambda_{\mathsf{NP}}}\right)^{4} , \quad \frac{\mathsf{BR}(H \to \tau \mu)}{\mathsf{BR}(H \to \tau \tau)} \sim g_{\mathsf{NP}}^{2} \left(\frac{v}{\Lambda_{\mathsf{NP}}}\right)^{4} \\ \frac{\mathsf{BR}(t \to c \mu e)}{\mathsf{BR}(t \to W b)} \sim \frac{g_{\mathsf{NP}}^{2}}{\mathsf{16}\pi^{2}} \left(\frac{v}{\Lambda_{\mathsf{NP}}}\right)^{4}$$

Compare to low energy probes (e.g. muon decays, tau decays)

$$\frac{\mathsf{BR}(\mu \to 3e)}{\mathsf{BR}(\mu \to e\nu_{\mu}\bar{\nu}_{e})} \sim g_{\mathsf{NP}}^{2} \left(\frac{v}{\Lambda_{\mathsf{NP}}}\right)^{4}$$

- Same dependence on NP couplings and scale, but much less Z, Higgs, top available in experiments
- Note: these are extremely generic/naive expectations; situation can be very different in concrete models.

# LFV Z Decays

### Existing/Expected Bounds

▶ Results from the LHC: ATLAS (139 fb<sup>-1</sup>)

Phys.Rev.Lett. 127 (2022) 271801; Nature Phys. 17 (2021) 7, 819-825; ATLAS-CONF-2021-042

 ${f BR}(Z o \mu e) < 3.04 imes 10^{-7} \ {f BR}(Z o au e) < 5.0 imes 10^{-6} \ {f BR}(Z o au \mu) < 6.5 imes 10^{-6}$ 

- ▶ Better than LEP for all decay modes.
- In all searches there are backgrounds ⇒ expect sensitivities to improve with √L, i.e. ~ factor of 5 at the HL-LHC.
- ► At Tera-Z factories expect  $BR(Z \rightarrow \mu e) \sim 10^{-8} 10^{-10}$  and  $BR(Z \rightarrow \tau \ell) \sim 10^{-9}$  (Dam 1811.09408)

- ► Z couplings are protected by SU(2) gauge symmetry
- $\Rightarrow$  generic expectation for a new physics effect

$$\frac{{\sf BR}(Z\to\ell\ell')}{{\sf BR}(Z\to\ell\ell)}\sim g_{\sf NP}^2\left(\frac{v}{\Lambda_{\sf NP}}\right)^4\sim 4\times 10^{-7}\times g_{\sf NP}^2\left(\frac{10\,{\sf TeV}}{\Lambda_{\sf NP}}\right)^4$$

 $\Rightarrow$  sensitivity to New Physics at scales of

 $\Lambda_{NP}\sim 10$  TeV at the HL-LHC  $\Lambda_{NP}\sim 50 \text{ TeV} \text{ at FCC-ee/CEPC}$ 

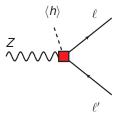

## LFV Z Decays in the EFT Framework

 Parameterize New Physics in a systematic and controlled way: in terms of dim-6 operators of the SMEFT

dipoles

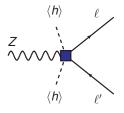

$$\mathcal{O}_{dW} = (\bar{\ell}\sigma^{\mu\nu}\tau^{a}P_{R}\ell')H W^{a}_{\mu\nu}$$

$$\mathcal{O}_{dB} = (\bar{\ell} \sigma^{\mu\nu} P_R \ell') H \ B_{\mu\nu}$$

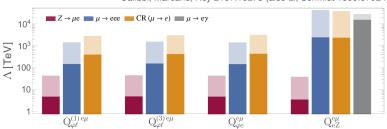

"Z penguins"

$$\mathcal{O}_{hl}^{(3)} = (H^{\dagger}i\overleftrightarrow{\mathsf{D}}_{\mu}^{a}H)(\bar{\ell}\gamma^{\mu}\tau^{a}P_{L}\ell')$$
$$\tilde{\mathcal{O}}_{hl}^{(1)} = (H^{\dagger}i\overleftrightarrow{\mathsf{D}}_{\mu}H)(\bar{\ell}\gamma^{\mu}P_{L}\ell')$$
$$\mathcal{O}_{he} = (H^{\dagger}i\overleftrightarrow{\mathsf{D}}_{\mu}H)(\bar{\ell}\gamma^{\mu}P_{R}\ell')$$

### Complementarity with Low Energy Probes

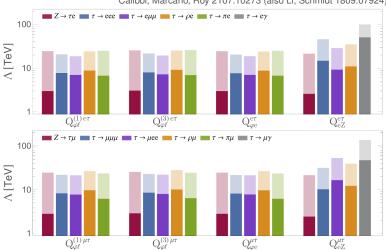

- Many flavor violating low energy processes will be affected as well.
- Severe indirect constraints on  $Z \rightarrow \mu e$  from  $\mu \rightarrow e\gamma$ ,  $\mu \rightarrow 3e$ ,  $\mu \rightarrow e$  conversion (barring accidental cancellations).

Calibbi, Marcano, Roy 2107.10273 (also Li, Schmidt 1809.07924)

## Complementarity with Low Energy Probes

#### Complementary sensitivity in the case of taus.

Calibbi, Marcano, Roy 2107.10273 (also Li, Schmidt 1809.07924)

### Current and Future Sensitivities

#### Results from the LHC

ATLAS 1907.06131 ( $\sim$  36 fb^{-1}), ATLAS 1909.10235 ( $\sim$  139 fb^{-1}), CMS 2105.03007 ( $\sim$  137 fb^{-1})

$$\begin{aligned} \mathsf{BR}(H \to \mu e) &< 6.1 \times 10^{-5} \\ \mathsf{BR}(H \to \tau e) &< 0.22\% \\ \mathsf{BR}(H \to \tau \mu) &< 0.15\% \end{aligned}$$

- ▶ Expect sensitivities to improve by ~ 1 order of mag. at the HL-LHC
- ► Expect sensitivities at future *e*<sup>+</sup>*e*<sup>-</sup> colliders that are at least as good (Qin et al. 1711.07243)

## The Higgs and Flavor

 $\mathcal{L}_{\text{Yukawa}} = \lambda_{ij} \, \overline{\Psi}_i \Psi_j \, H$ 

 In the Standard Model the Yukawa couplings are the only sources of flavor and CP violation
 → the couplings of the Higgs to fermion mass eigenstates are flavor diagonal and CP conserving

$$\frac{1}{\nu} \begin{pmatrix} m_{u,d,e} & 0 & 0 \\ 0 & m_{c,s,\mu} & 0 \\ 0 & 0 & m_{t,b,\tau} \end{pmatrix}$$

## The Higgs and Flavor

$$\mathcal{L}_{\text{Yukawa}} = \lambda_{ij} \, \bar{\Psi}_i \Psi_j \, H + \frac{\lambda_{ij}}{\Lambda^2} \, \bar{\Psi}_i \Psi_j \, H^3$$

 In the Standard Model the Yukawa couplings are the only sources of flavor and CP violation
 → the couplings of the Higgs to fermion mass eigenstates are flavor diagonal and CP conserving

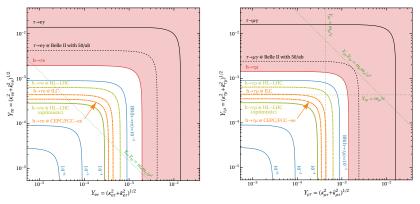

$$\frac{1}{\nu} \begin{pmatrix} m_{u,d,e} & 0 & 0 \\ 0 & m_{c,s,\mu} & 0 \\ 0 & 0 & m_{t,b,\tau} \end{pmatrix} + \frac{\nu^2}{\Lambda^2} \begin{pmatrix} \star & \star & \star \\ \star & \star & \star \\ \star & \star & \star \end{pmatrix}$$

New Physics can modify the flavor diagonal Higgs couplings
 New Physics can lead to flavor and CP violating Higgs couplings

Phenomenological parameterization:  $\mathcal{L}_{CLFV} = -\underline{Y}_{\ell\ell'} \bar{\ell} P_R \ell' h + h.c.$ 

# Bounds on Flavor Violating Higgs Couplings

WA, Caillol, Dam, Xella, Zhang 2205.10576

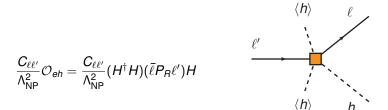

• Weak indirect constraints from  $\tau \to \mu \gamma$  and  $\tau \to e \gamma$ .

•  $\mu \rightarrow e\gamma$  strongly constrains BR( $H \rightarrow \mu e$ ) and BR( $H \rightarrow \tau \mu$ )×BR( $H \rightarrow \tau e$ )

Blankenburg, Ellis, Isidori 1107.1216; Harnik, Kopp, Zupan 1209.1397; Davidson, Verdier 1211.1248

## LFV Higgs Decays in the EFT Framework

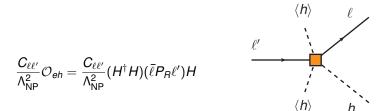

Gives flavor changing Higgs couplings

$$Y_{\ell\ell'} = \frac{C_{\ell\ell'}}{\sqrt{2}} \frac{v^2}{\Lambda_{NP}^2} \sim 4 \times 10^{-4} \left(\frac{10\,\text{TeV}}{\Lambda_{NP}}\right)^2$$

 Expected sensitivities at future machines probe new physics at Λ<sub>NP</sub> ~ 10 TeV.

# LFV Higgs Decays in the EFT Framework

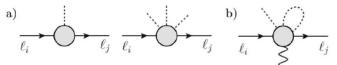

$$Y_{\ell\ell'} = \frac{C_{\ell\ell'}}{\sqrt{2}} \frac{v^2}{\Lambda_{\text{NP}}^2} \sim 4 \times 10^{-4} \left(\frac{10\,\text{TeV}}{\Lambda_{\text{NP}}}\right)^2$$

- Expected sensitivities at future machines probe new physics at Λ<sub>NP</sub> ~ 10 TeV.
- Comment: need to be very careful when calculating loops outside the EFT framework. Results might be gauge dependent. (WA, Gori, Hamer, Patel arXiv:2009.01258)

## LFV Higgs Decays in NP Models

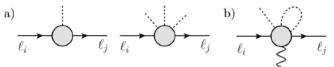

In new physics models one often encounters strong constraints: The physics that generates the LFV Higgs coupling, will typically also give direct contributions to radiative decays (Dorsner et al. 1502.07784)

Contributions to lepton Yukawa couplings (a), electromagnetic dipole (b)

## LFV Higgs Decays in NP Models

In new physics models one often encounters strong constraints: The physics that generates the LFV Higgs coupling, will typically also give direct contributions to radiative decays (Dorsner et al. 1502.07784)

Contributions to lepton Yukawa couplings (a), electromagnetic dipole (b)

#### handwavy upper bound in many models

(assuming that the Wilson coefficient of the dipole is  $\frac{1}{16\pi^2}$  × the Wilson coefficient of the Higgs penguin)

$$\mathsf{BR}(h o au\mu) \sim 26 imes \mathsf{BR}( au o \mu\gamma) \lesssim 10^{-6}$$

WA, Gori, Kagan, Silvestrini, Zupan 1507.07927

⇒ Observation of a LFV Higgs decay with expected exp. sensitivities likely implies an additional source of EW symmetry breaking

# LFV Top Decays

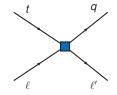

## EFT Setup and Sensitivity to New Physics

3 body decays that violate lepton and quark flavor  $t \rightarrow q\ell\ell'$ 

(Davidson, Mangano, Perries, Sordini 1507.07163)

$$\mathcal{O}_{LL} = (\bar{q}\gamma_{\mu}P_{L}t)(\bar{\ell}\gamma^{\mu}P_{L}\ell')$$
$$\mathcal{O}_{RR} = (\bar{q}\gamma_{\mu}P_{R}t)(\bar{\ell}\gamma^{\mu}P_{R}\ell')$$

+ many other Dirac structures

The decays are competing with an unsuppressed 2 body decay t 
ightarrow Wb

$$\mathsf{BR}(t \to c \mu e) \sim \frac{g_{\mathsf{NP}}^2}{16\pi^2} \left(\frac{v}{\Lambda_{\mathsf{NP}}}\right)^4 \sim 2 \times 10^{-5} \times g_{\mathsf{NP}}^2 \left(\frac{1\,\mathsf{TeV}}{\Lambda_{\mathsf{NP}}}\right)^4$$

- Strong indirect bounds from B meson decays if left handed quarks are involved.
- ► For right handed quarks, LHC has the best sensitivity.

# **Experimental Sensitivity**

- ► Look for  $t\bar{t}$  production followed by a rare top decay  $t \rightarrow q\mu e$  and also for non-standard single top production  $gq \rightarrow t\mu e$ .
- Main background from tt
  , which gives two b-jets
- Signal has only a single b-jet
- Translation into top branching ratio depends on the Dirac structure of the operator

 $BR(t \rightarrow u \mu e) \lesssim 10^{-7}$ 

 $\mathsf{BR}(t \to c \mu e) \lesssim 10^{-6}$ 

- ► Expect factor of ~ 5 improvement at HL-LHC
- For further improvement need FCC-hh

# LFV New Physics Resonances

### LFV New Physics Resonances

 Many BSM scenarios contain neutral resonances that can have lepton flavor violating couplings

e.g. Z' bosons, or additional neutral Higgs bosons H.

 Obvious approach: extend the Z and Higgs searches to higher (and lower!) masses

$$\begin{split} & \textit{pp} \rightarrow \textit{Z}' \rightarrow \textit{e}\mu, \textit{e}\tau, \mu\tau \ , \qquad \textit{pp} \rightarrow \textit{H} \rightarrow \textit{e}\mu, \textit{e}\tau, \mu\tau \\ & \textit{e}^+\textit{e}^- \rightarrow \textit{Z}' \rightarrow \textit{e}\mu, \textit{e}\tau, \mu\tau \ , \qquad \textit{e}^+\textit{e}^- \rightarrow \textit{Z} + \textit{H} \rightarrow \textit{Z} + \textit{e}\mu, \textit{e}\tau, \mu\tau \end{split}$$

 In contrast to standard high-mass di-lepton resonance searches, no irreducible background from Drell-Yan

### **Exotic Scenarios**

- Can imagine exotic scenarios: e.g. a Z' that couples dominantly in a flavor violating way to  $\tau\mu$  (can give a viable explanation of  $(g-2)_{\mu}$ )
- Currently weakly constrained, but could give spectacular same sign lepton pair signatures at lepton colliders

e.g. 
$$e^+e^- \rightarrow Z'\tau^+\mu^- \rightarrow \tau^+\tau^+\mu^-\mu^-$$

WA, Caillol, Dam, Xella, Zhang 2205.10576 (update of WA, Chen, Dev, Soni 1607.06832)

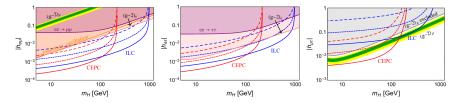

### More Exotic Scenarios

 Similar results are found for additional Higgs boson that have only flavor violating couplings

e.g. 
$$e^+e^- \rightarrow H\mu^+e^- \rightarrow \mu^+\mu^+e^-e^-$$

Dev, Mohapatra, Zhang 1711.08430

 Model building challenge: construct a model in which these exotic Z' or Higgs bosons with only flavor violating couplings arise.

### Summary
