

# MicroBooNE Report

Žarko Pavlović & Ralitsa Sharankova  
Proton Management Group Meeting

December 5, 2019

# Data taking

- **Average DAQ uptime 95%**
- POT delivered:  $3.29e19$   
POT on tape:  $3.18e19$   
**Fraction recorded: 97%**

# Computing Summary

Average Jobs Running Concurrently

2537

Total Jobs Run

1963937

Average Time Spent Waiting in Queue (Production)

2.340 hour

Total Data Cataloged

22.9 PB

# Trigger inefficiency

- Dead time  $\sim 30\text{ms}$  after trigger may result in a trigger inefficiency
- When NuMI and BNB events get closer than  $30\text{ms}$  we record only the one that came first
- Not significant in past runs, but seen some inefficiency with NuMI during special runs (low intensity, target scans, ...)
- More pronounced during this run (overall couple % with NuMI, but also seen losses with BNB)
- Many thanks to Cindy Joe, John Kuharik and MCR on identifying issues with timeline and making adjustments when possible (rearranging events by hand)
- Talking to ICARUS and SBND to understand impact
- Note that besides deadtime, events getting closer than few ms would present a problem for LAr TPCs due to  $O(\text{few ms})$  readout window

Few percent  
loss with BNB

# Argon sample

- Roberto Santorelli (CIEMAT in Madrid) has offered to help us analyze Argon sample
- Capable of measuring ppb contaminations
- Better understand MicroBooNE scintillation light decline over time
- Catch some unexpected contamination (like the Hg found in the gas used for ArDM)

# Physics news

- New paper: “Search for heavy neutral leptons decaying into muon-pion pairs in the MicroBooNE detector” on arxiv: 1911.10545 and submitted to PRD
- Upcoming analysis workshop at BNL  
(December 9-13)
