Light analysis on-going

- **Detector performance:**
 - PMT gain calibration and stability
 - PEN vs. TPB efficiency study
 - Tau-slow monitoring
 - System limitations (noise)
- **Light propagation** in LAr in different drift field conditions, and comparing to simulations (y -drift geometry)
- **Single photo-electron rate** under different conditions (fields, PMT coincidence) to understand low-energy background.
- **Muon-detection** efficiency.
- **T_0 capability.**
- **S2 study:** e- drift information, electroluminescence production.
- **Light and charge** combined analysis: muon tagging and calorimetry improvement.

DUNE-FD studies

- **Proton decay:** Photon detection system provides t_0 (vertex position in the drift direction). Studies by **José Soto** for different Dual-Phase FD configurations (w/ & w/o reflector foils)

- **Supernova:** Triggering efficiency studies by **Ana Gallego** for different Dual-Phase Far Detector configurations. **Inés Gil Botella** is convener of the Supernova and Low Energy Neutrino Physics Working Group
