

Direct neutrino mass
measurement:
KATRIN, ^{163}Ho , Project 8

Ben Monreal, UCSB (—> Case Western)

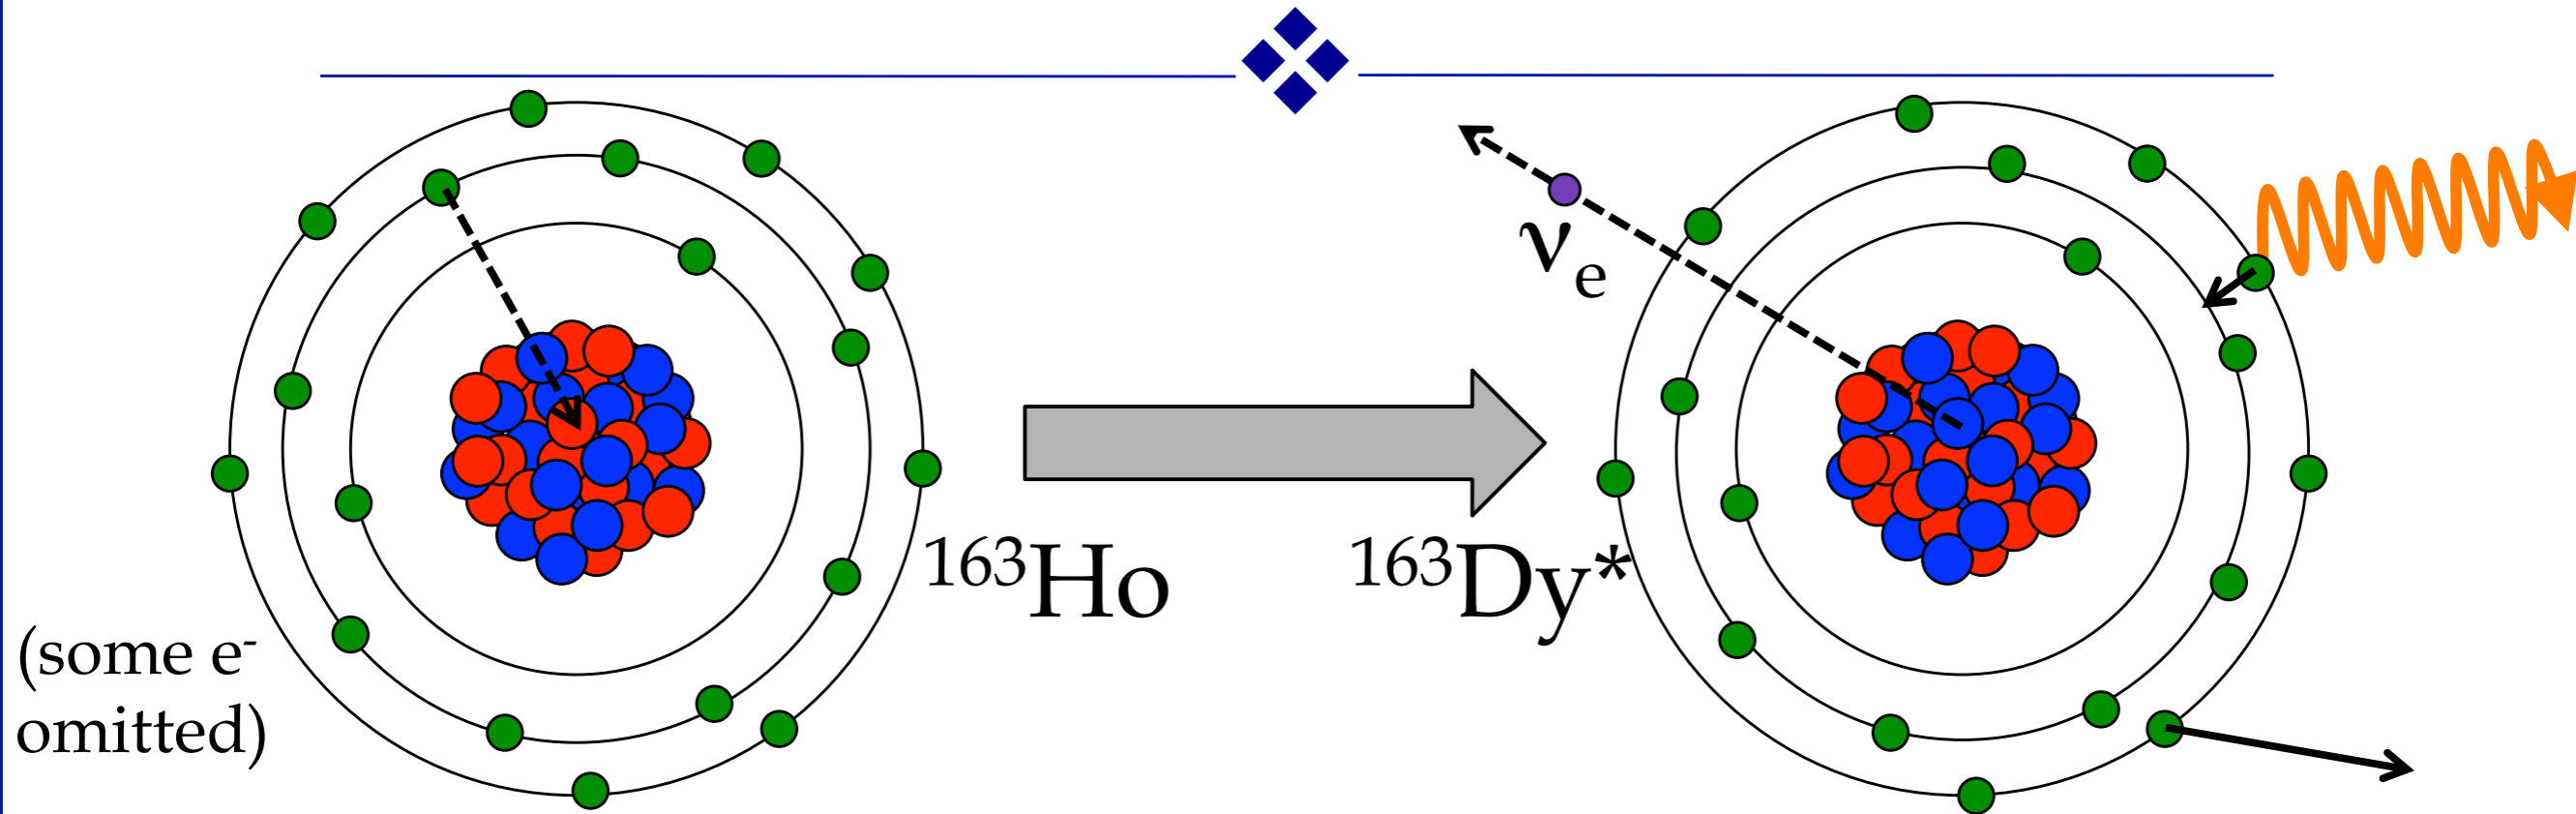

Direct = kinematic neutrino mass measurement

Measure kinematics
of a three-body decay with a
neutrino nearly at rest

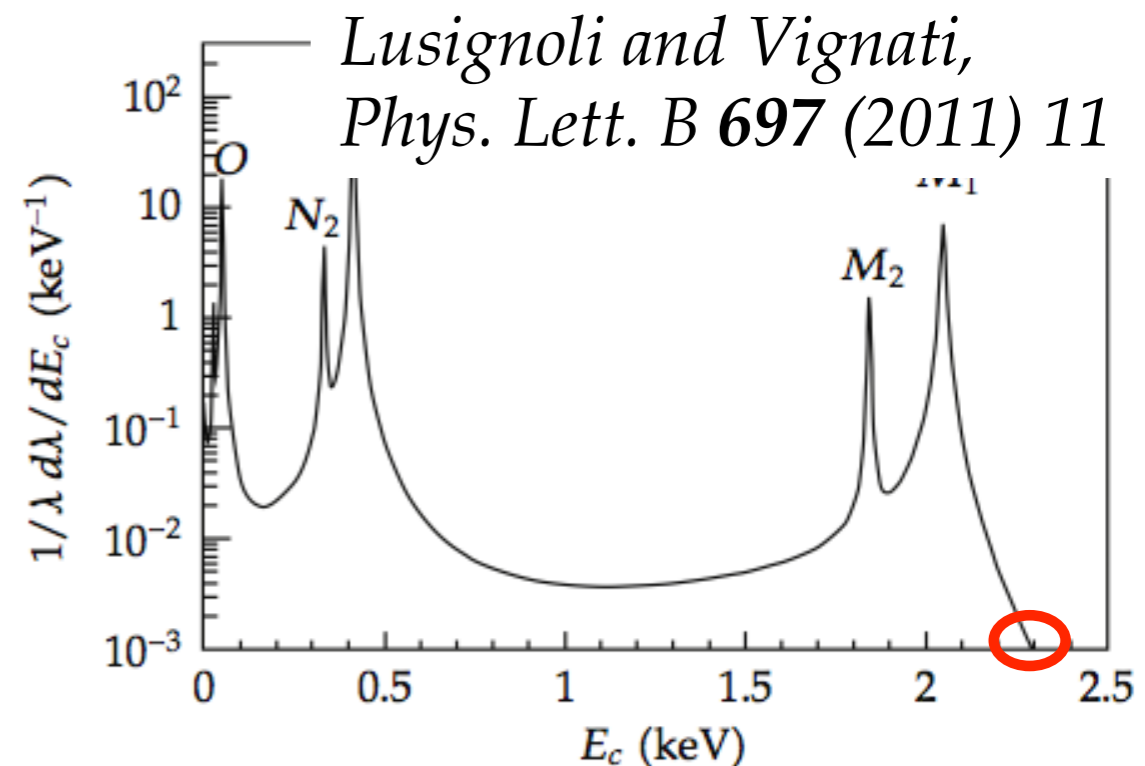

- Tiny phase space = rare
- need good energy resolution
- same energy scale as atomic/
molecular effects

Direct m_ν from Electron Capture

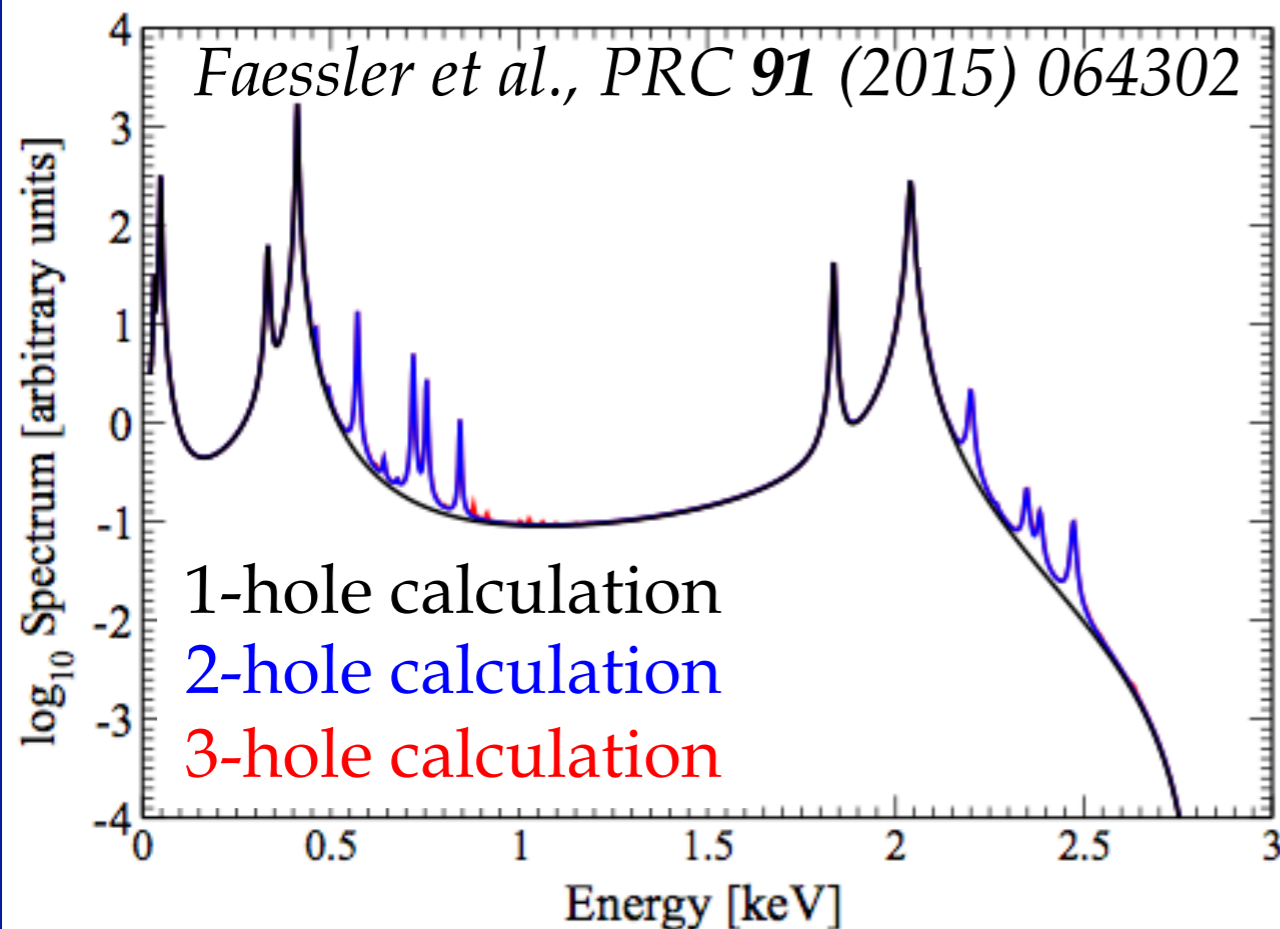

★ Capture de-excitation energy in $^{163}\text{Ho} \rightarrow ^{163}\text{Dy}^* + \nu_e$

^{163}Ho : Shakeup

- ★ Standard spectral calculation assumes 1 e^- vacancy
- ★ What about $^{163}\text{Dy}^*$ states with two or more holes?

- ★ New resonance(s)
- ★ Structure near endpoint complicates m_ν^2 extraction

Robertson, PRC 91 (2015) 035504

Faessler and Šimkovic, PRC 91 (2015) 045505

Faessler et al., PRC 91 (2015) 064302

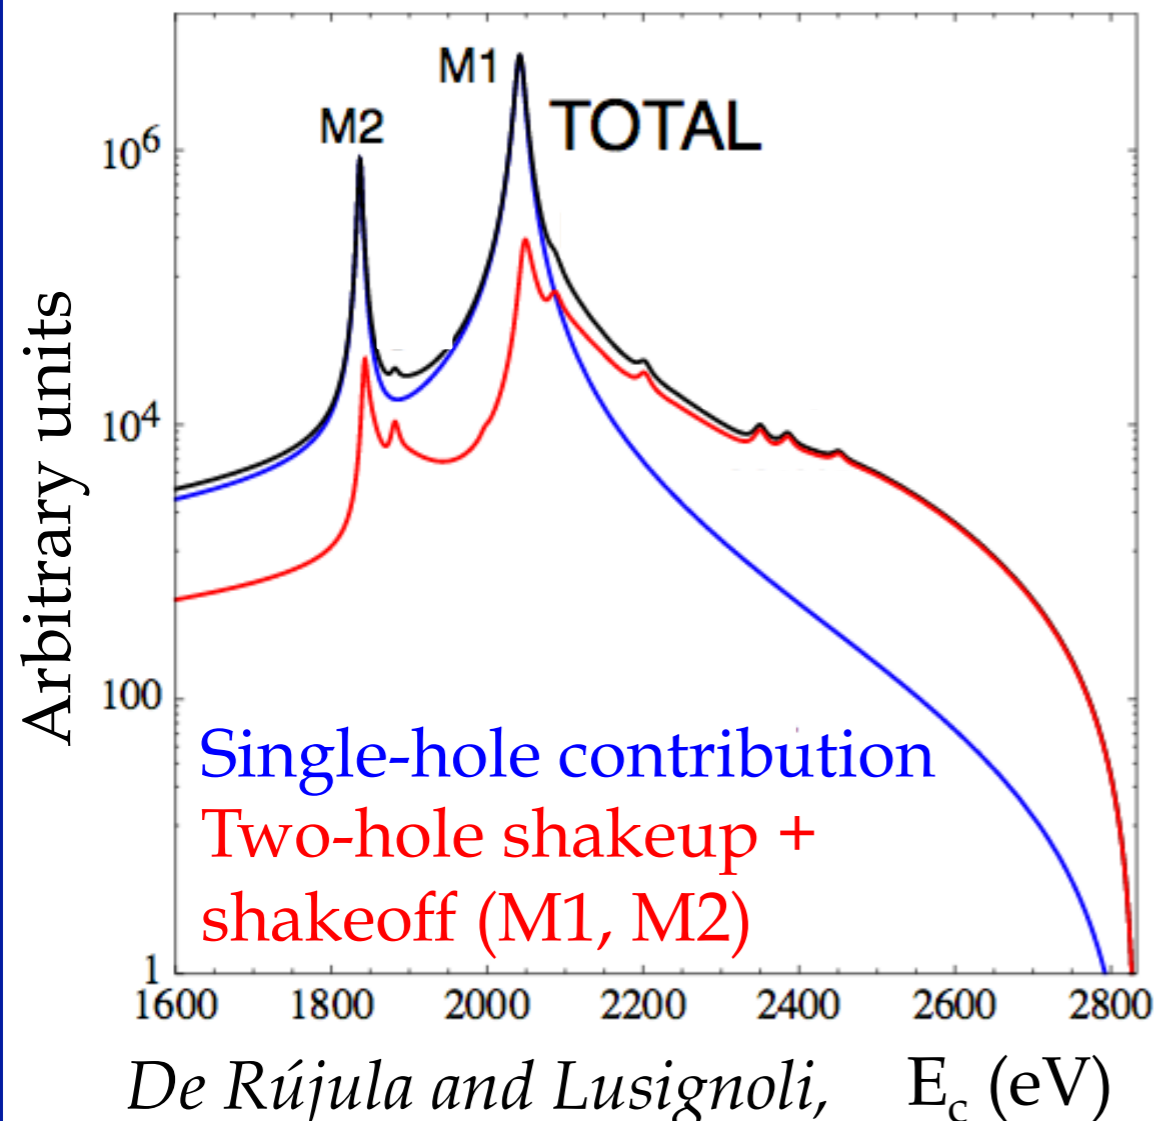

- ★ Looks like a few % effect, separated from endpoint

^{163}Ho : Shakeoff

- ★ Electrons can also be excited to the continuum

- ★ 3-body process, $^{163}\text{Ho} \rightarrow ^{163}\text{Dy}[H, H'] + e^- + \nu_e$

*De Rújula and Lusignoli,
JHEP 2016 15, 2016*

- ★ Recent preliminary calculations near endpoint

- ★ Enhanced statistics (40x near endpoint)

- ★ Relative pileup contribution reduced

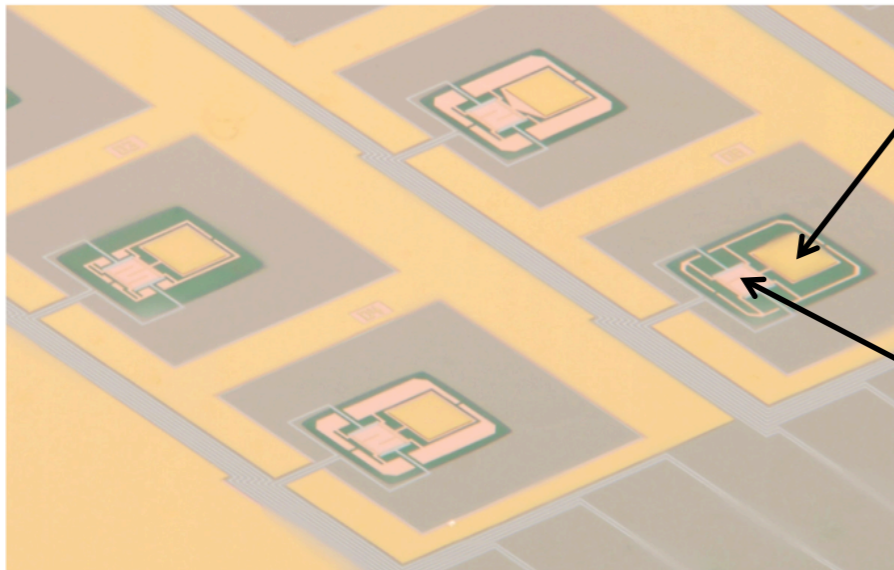

- ★ More complex analysis?

- ★ Ongoing theory work

e- transmission
this month!

KATRIN status

Example of unexpected background:
a) Radioactivity sputters H^* from wall
b) H^* thermally ionizes in flight

- Tritium fill/data in 2017
- Current expectations:
 - Background rates *worse* than design report
 - ~~0.20~~ 0.23 eV sensitivity
 - Systematics control *better* than design report

The Project 8 concept

Cyclotron radiation

- emitted by mildly relativistic electrons
- Coherent, narrowband
- 10^{-15} W per electron

$$P_{\text{tot}} = \frac{1}{4\pi\epsilon_0} \frac{2q^2\omega_c^2}{3c} \frac{\beta_{\perp}^2}{1-\beta^2}$$

- Electron energy contributes to velocity v , power P , frequency ω
- *Can we detect this radiation, measure v , P , ω , and determine $E \pm 1$ eV?*

$$f_{\gamma} = \frac{f_c}{\gamma} = \frac{eB}{2\pi(m_e + K/c^2)}$$

Phase I

- ▶ Demonstrate single-electron detection
- ▶ CRES spectrum of ^{83}mKr
- ▶ 2010 – 2016
- ▶ ^{83}mKr source
- ▶ Waveguide

done!

Phase II

- ▶ Kurie plot and systematics studies
- ▶ $m_\nu < 10\text{--}100\text{ eV}$
- ▶ 2015 – 2017
- ▶ T_2 source
- ▶ Waveguide

imminent

Phase III

- ▶ High-rate sensitivity
- ▶ $m_\nu < 2\text{ eV}$
- ▶ 2016 – 2020
- ▶ T_2 source
- ▶ Phased antenna array

design

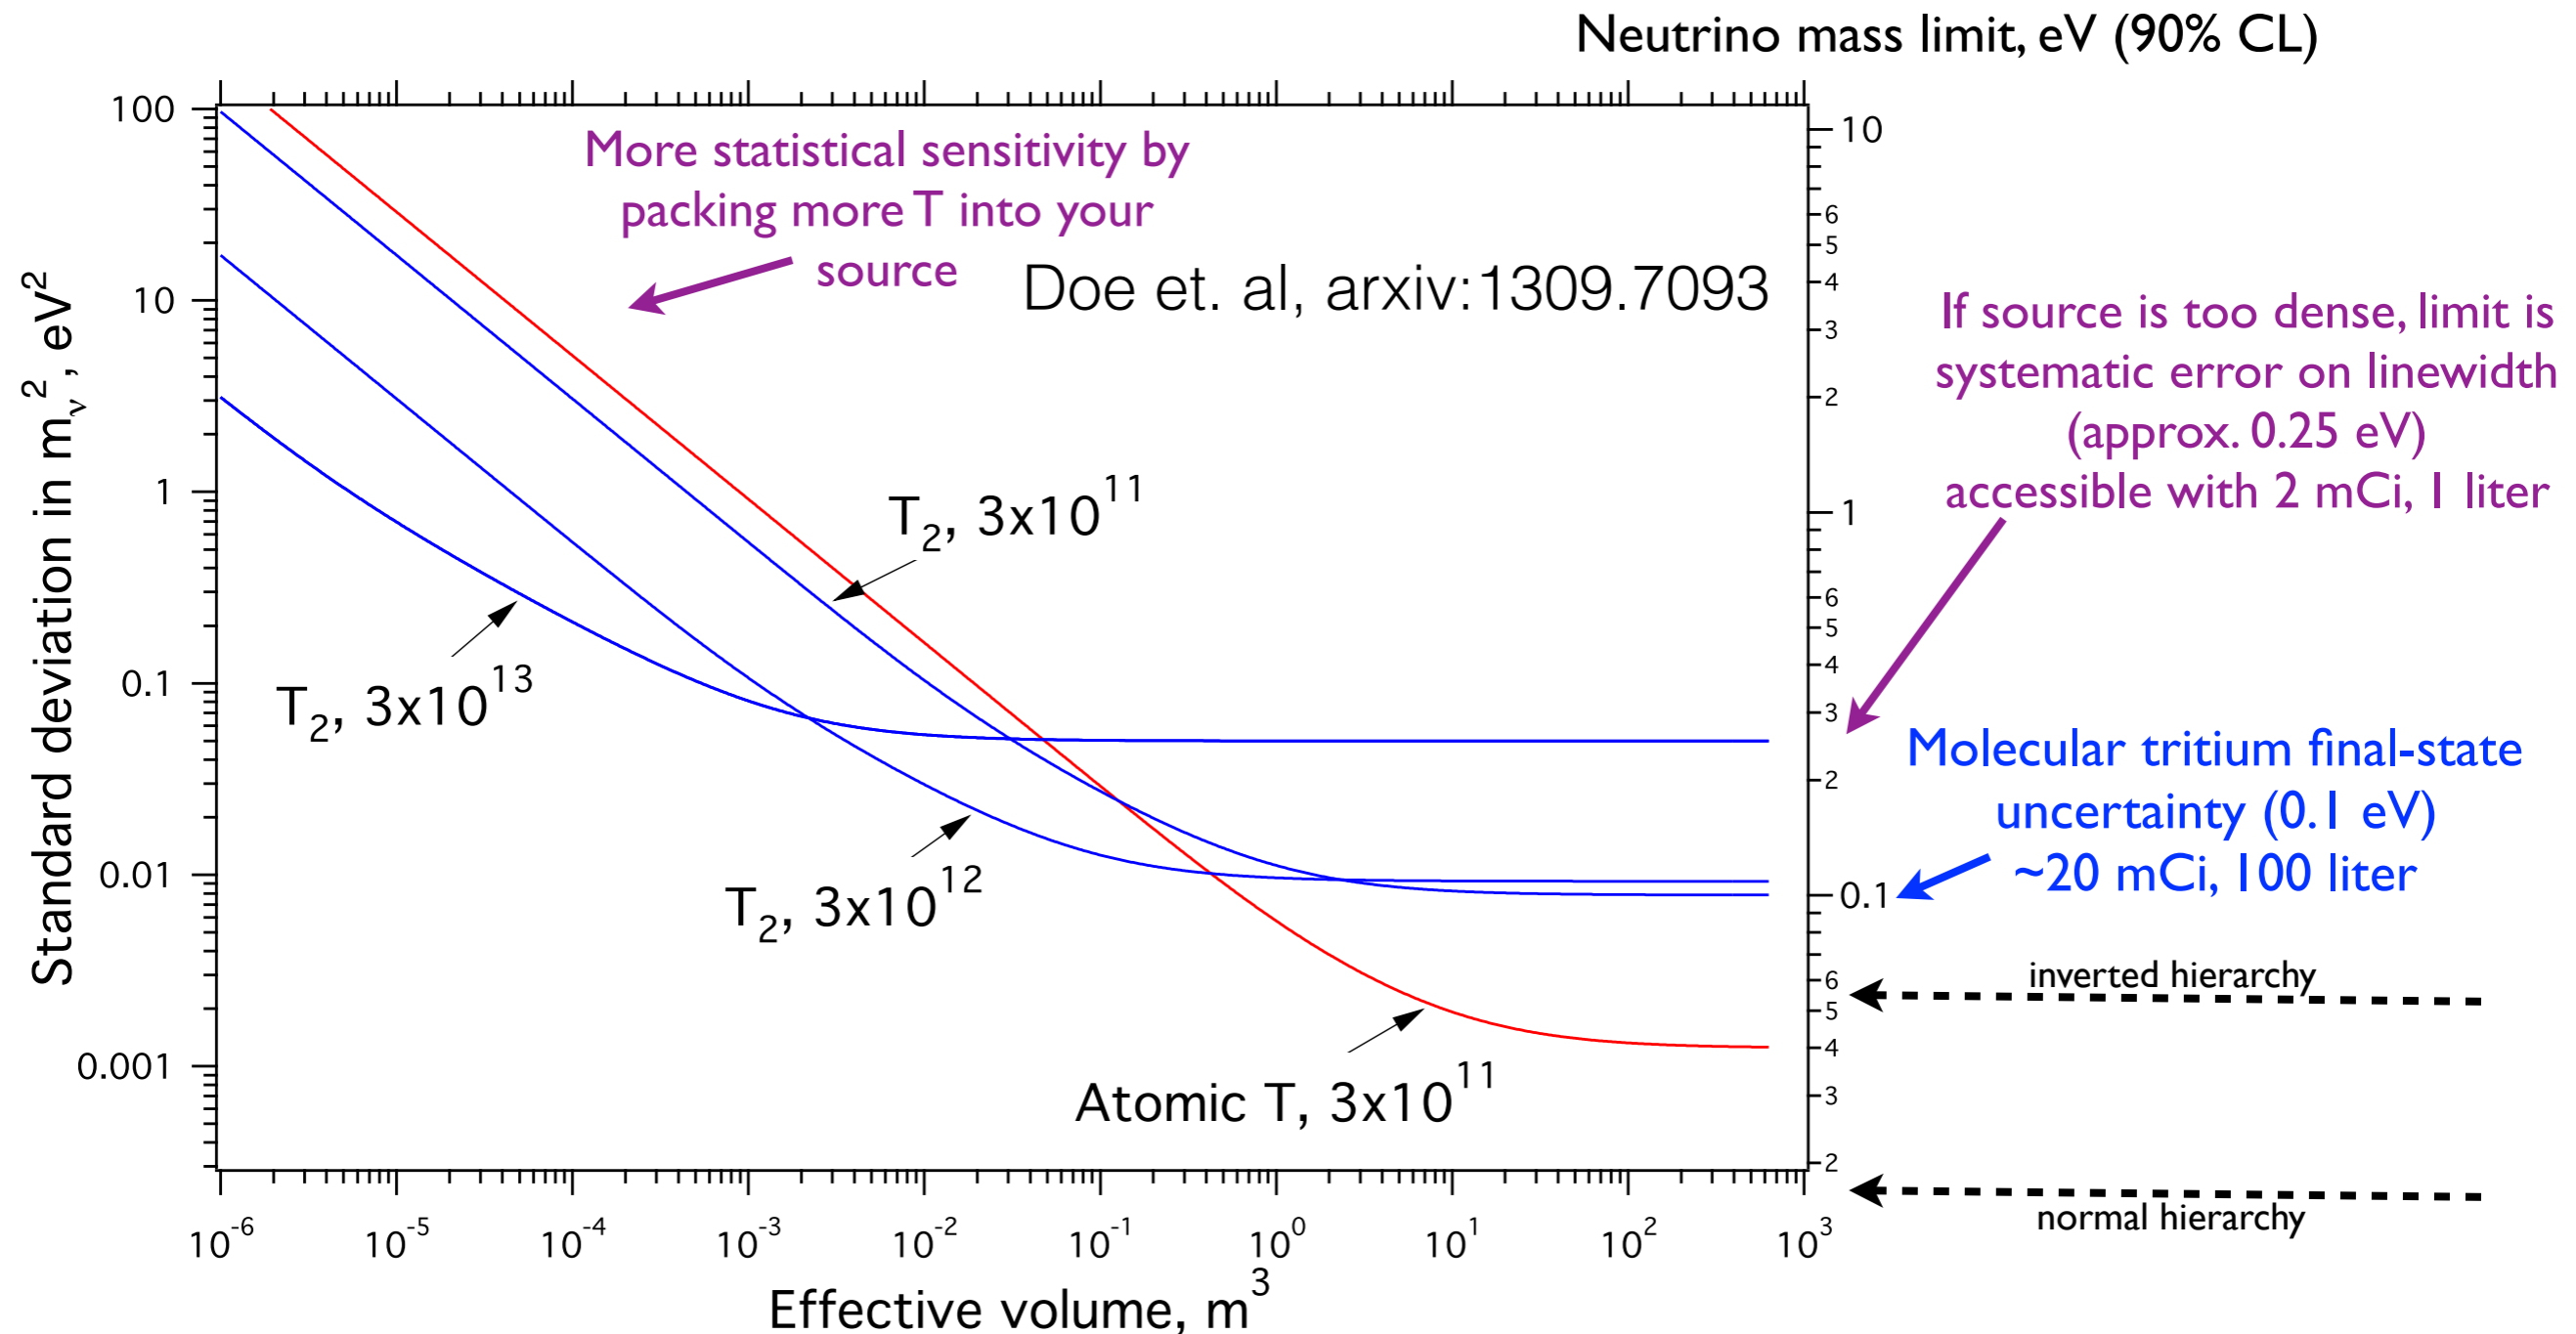

Phase IV

- ▶ Atomic tritium source
- ▶ $m_\nu < 40\text{ meV}$
- ▶ 2017 –
- ▶ T source
- ▶ ?

**concept
studies**

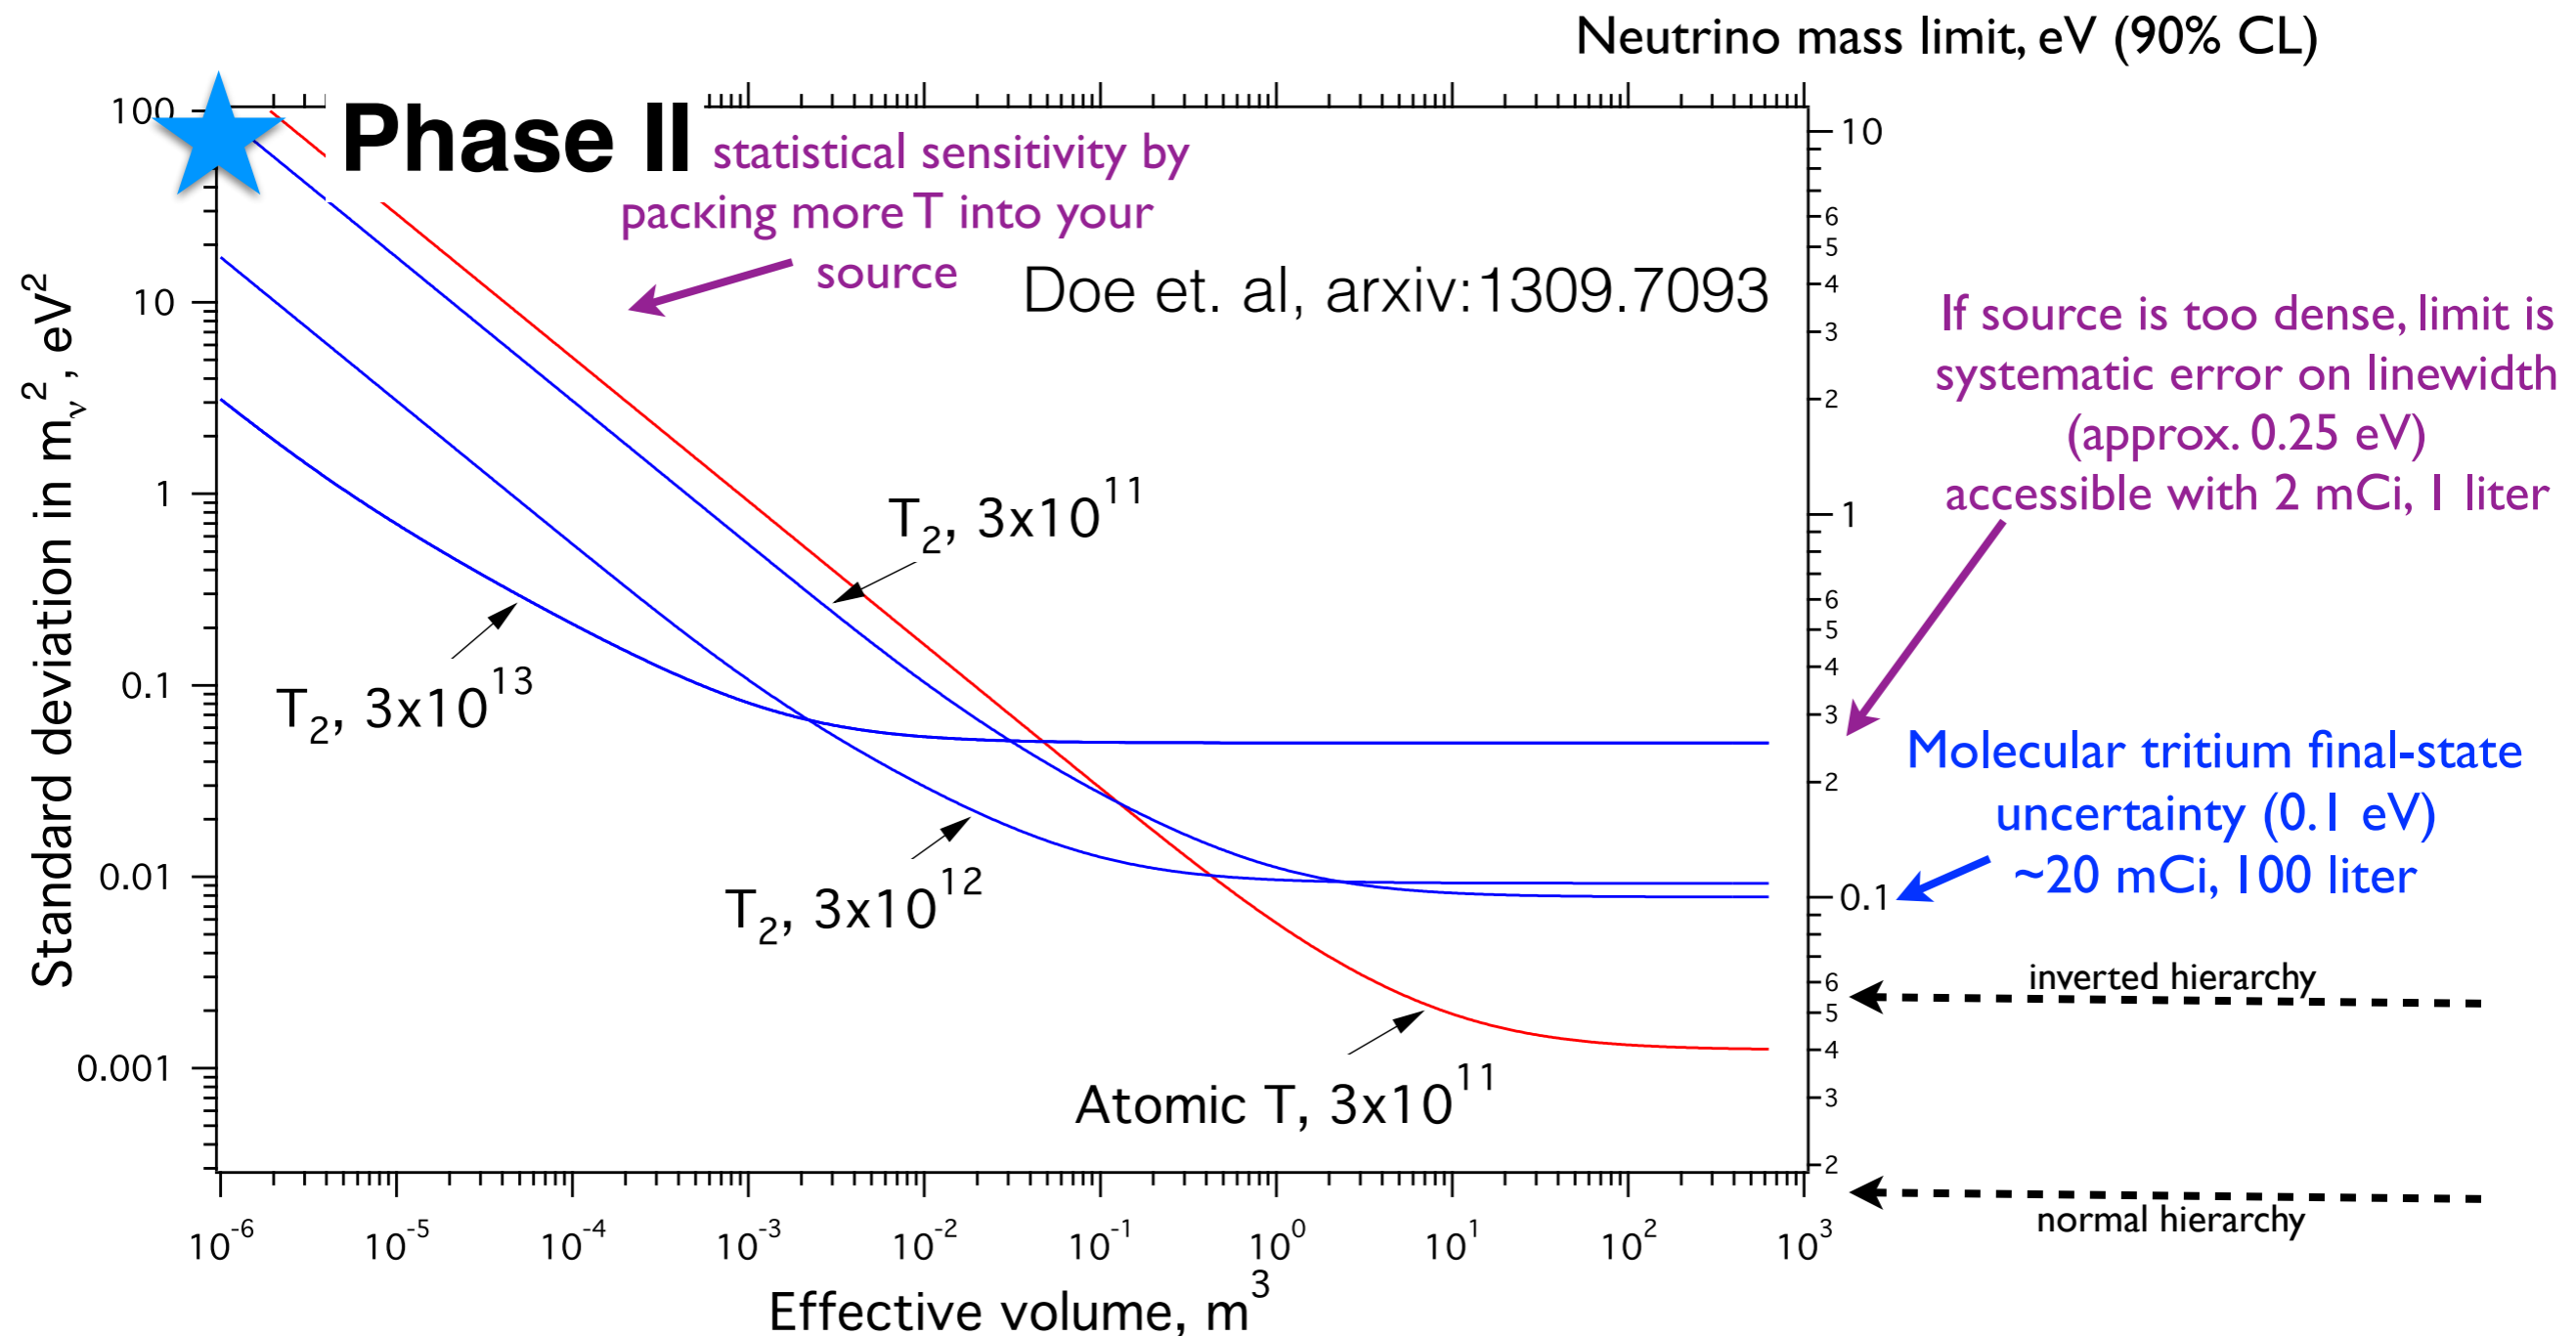

Project 8 sensitivity estimates: Small and high-density or large and low-density?

Details: B=1 Tesla, background = 1 μ Hz/eV, livetime 1y, angular acceptance 1 ster, pressure broadening known to 1%, field broadening $< 10^{-7}$

Project 8 sensitivity estimates: Small and high-density or large and low-density?

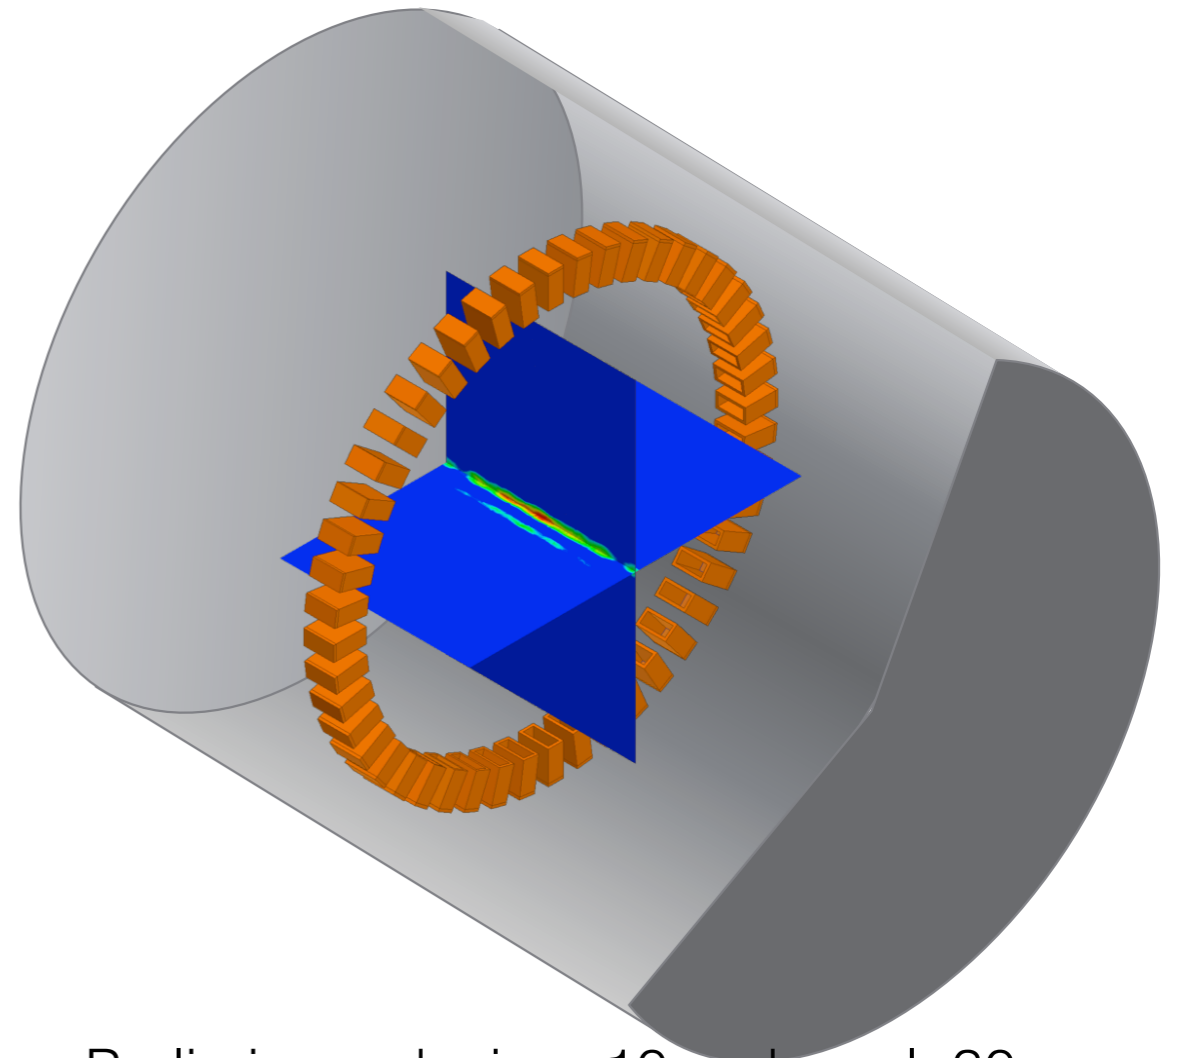

Details: $B=1$ Tesla, background = $1 \mu\text{Hz}/\text{eV}$, livetime 1y, angular acceptance 1 ster, pressure broadening known to 1%, field broadening $< 10^{-7}$

Phase III: multi-antenna

- Surplus MRI magnet
- 10^{-6} uniformity in central 50cm

"Antenna barrel": must choose a focus if you want to coherently add signals

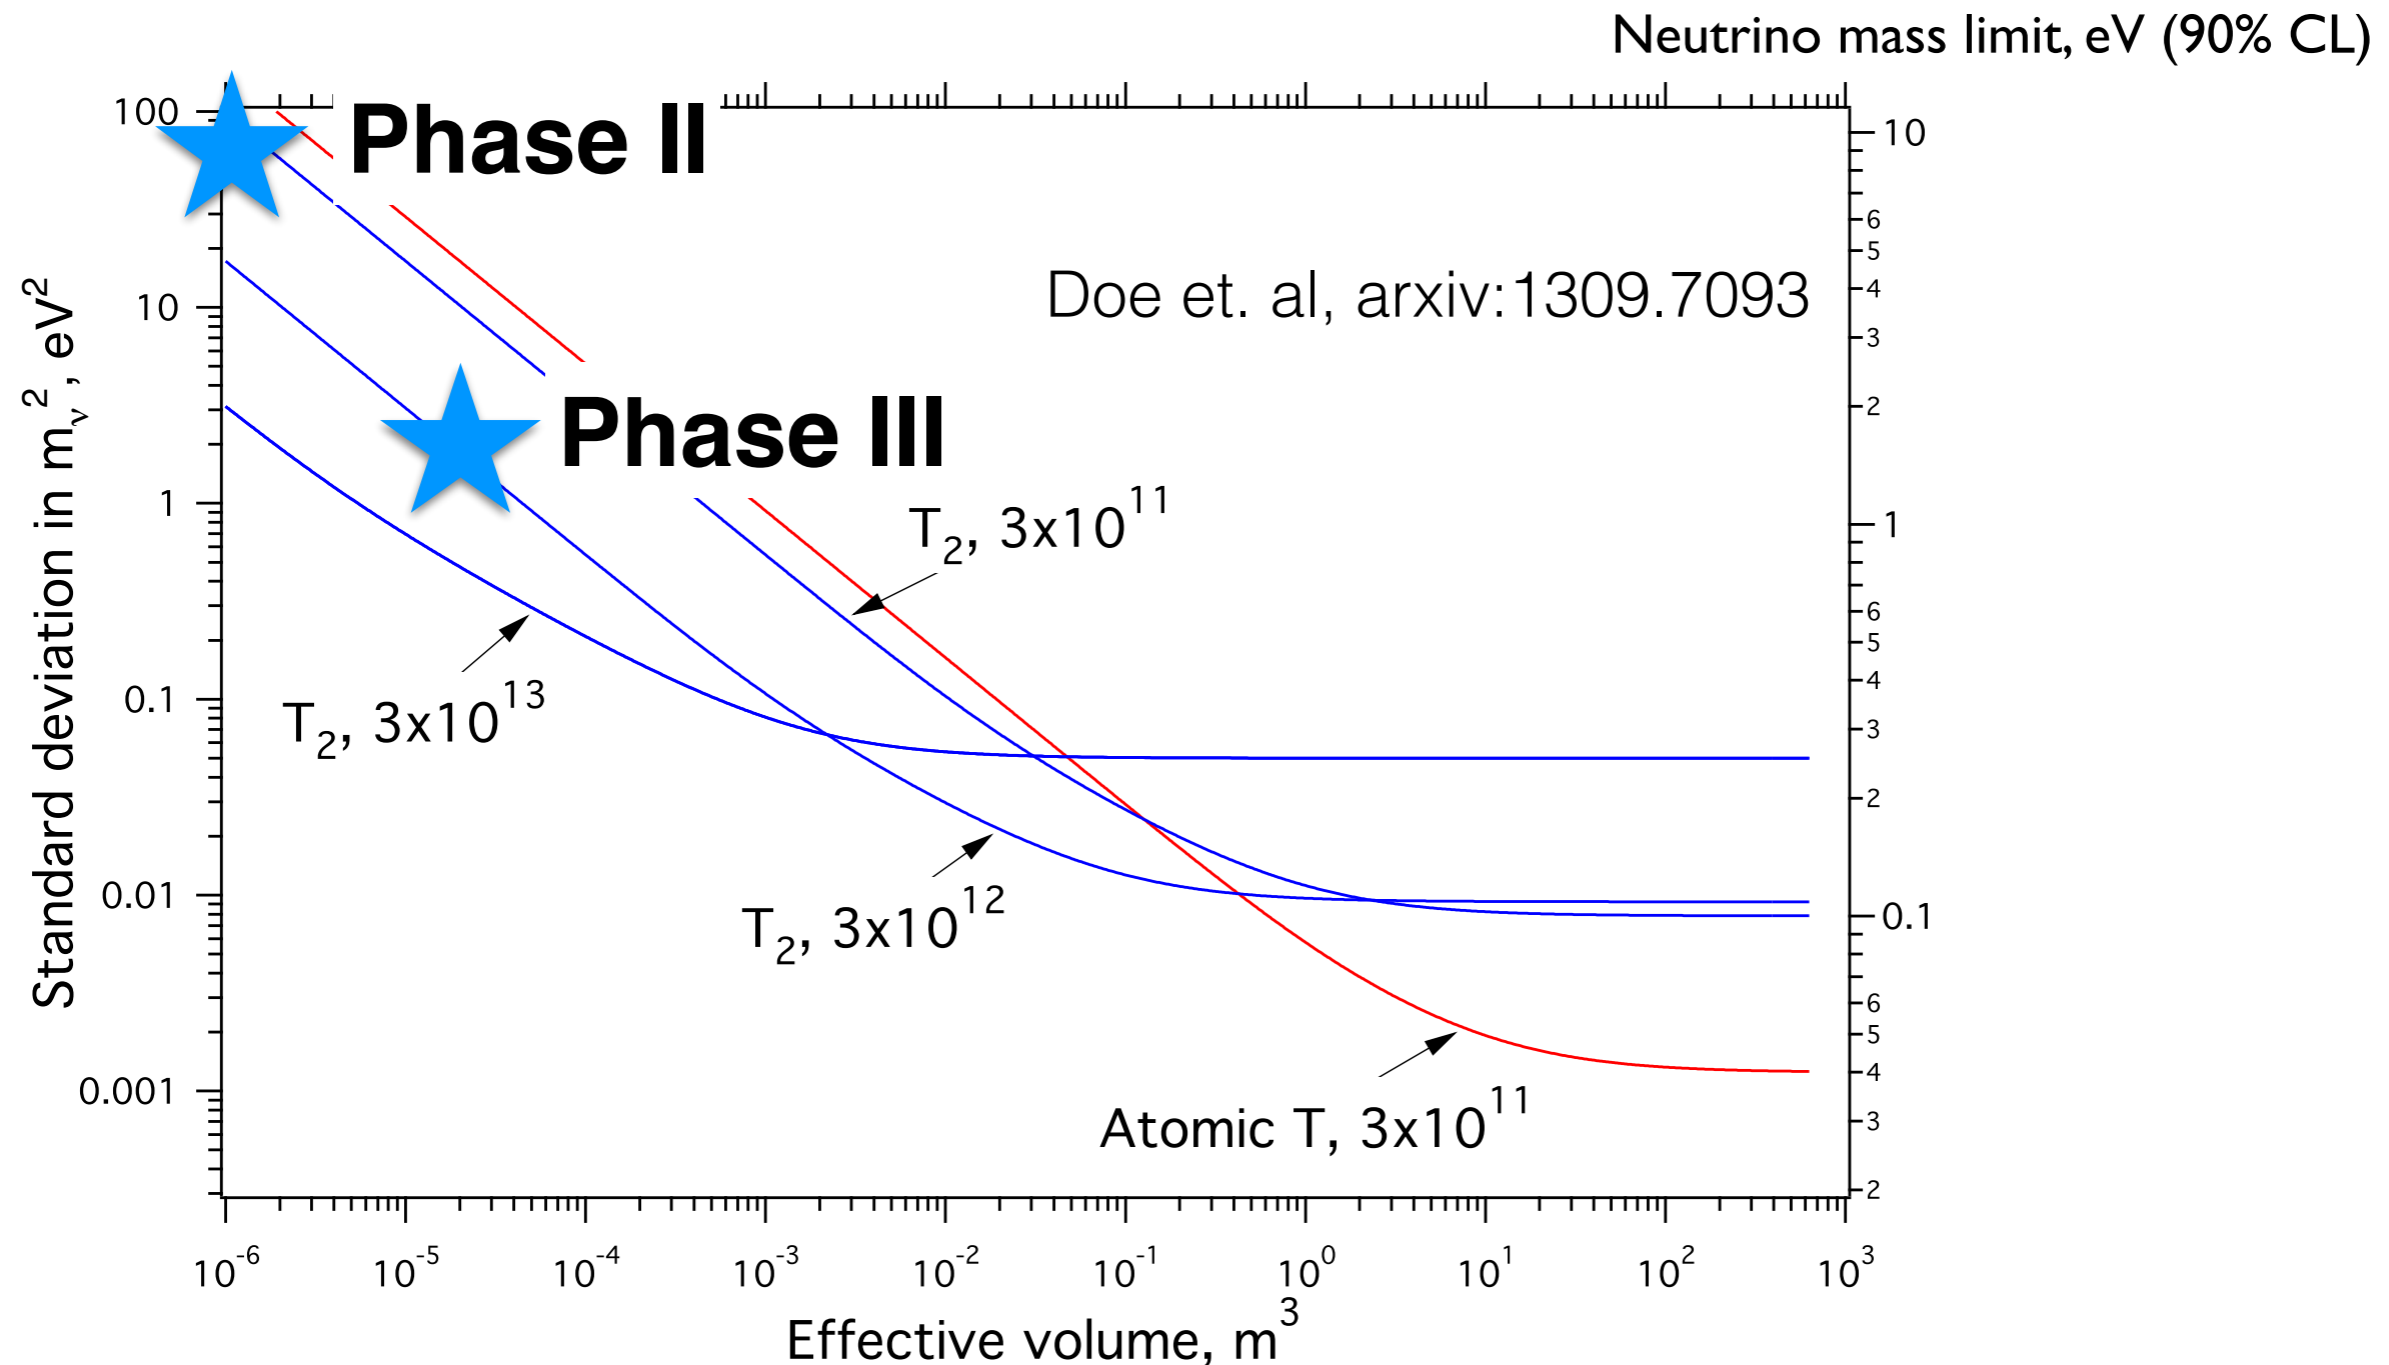

Preliminary design: 10cm barrel, 30 antennas, >10 dB SNR.

ROACH2 + GPU farm for synthetic focus
= radio astronomy tech

Project 8 sensitivity estimates:

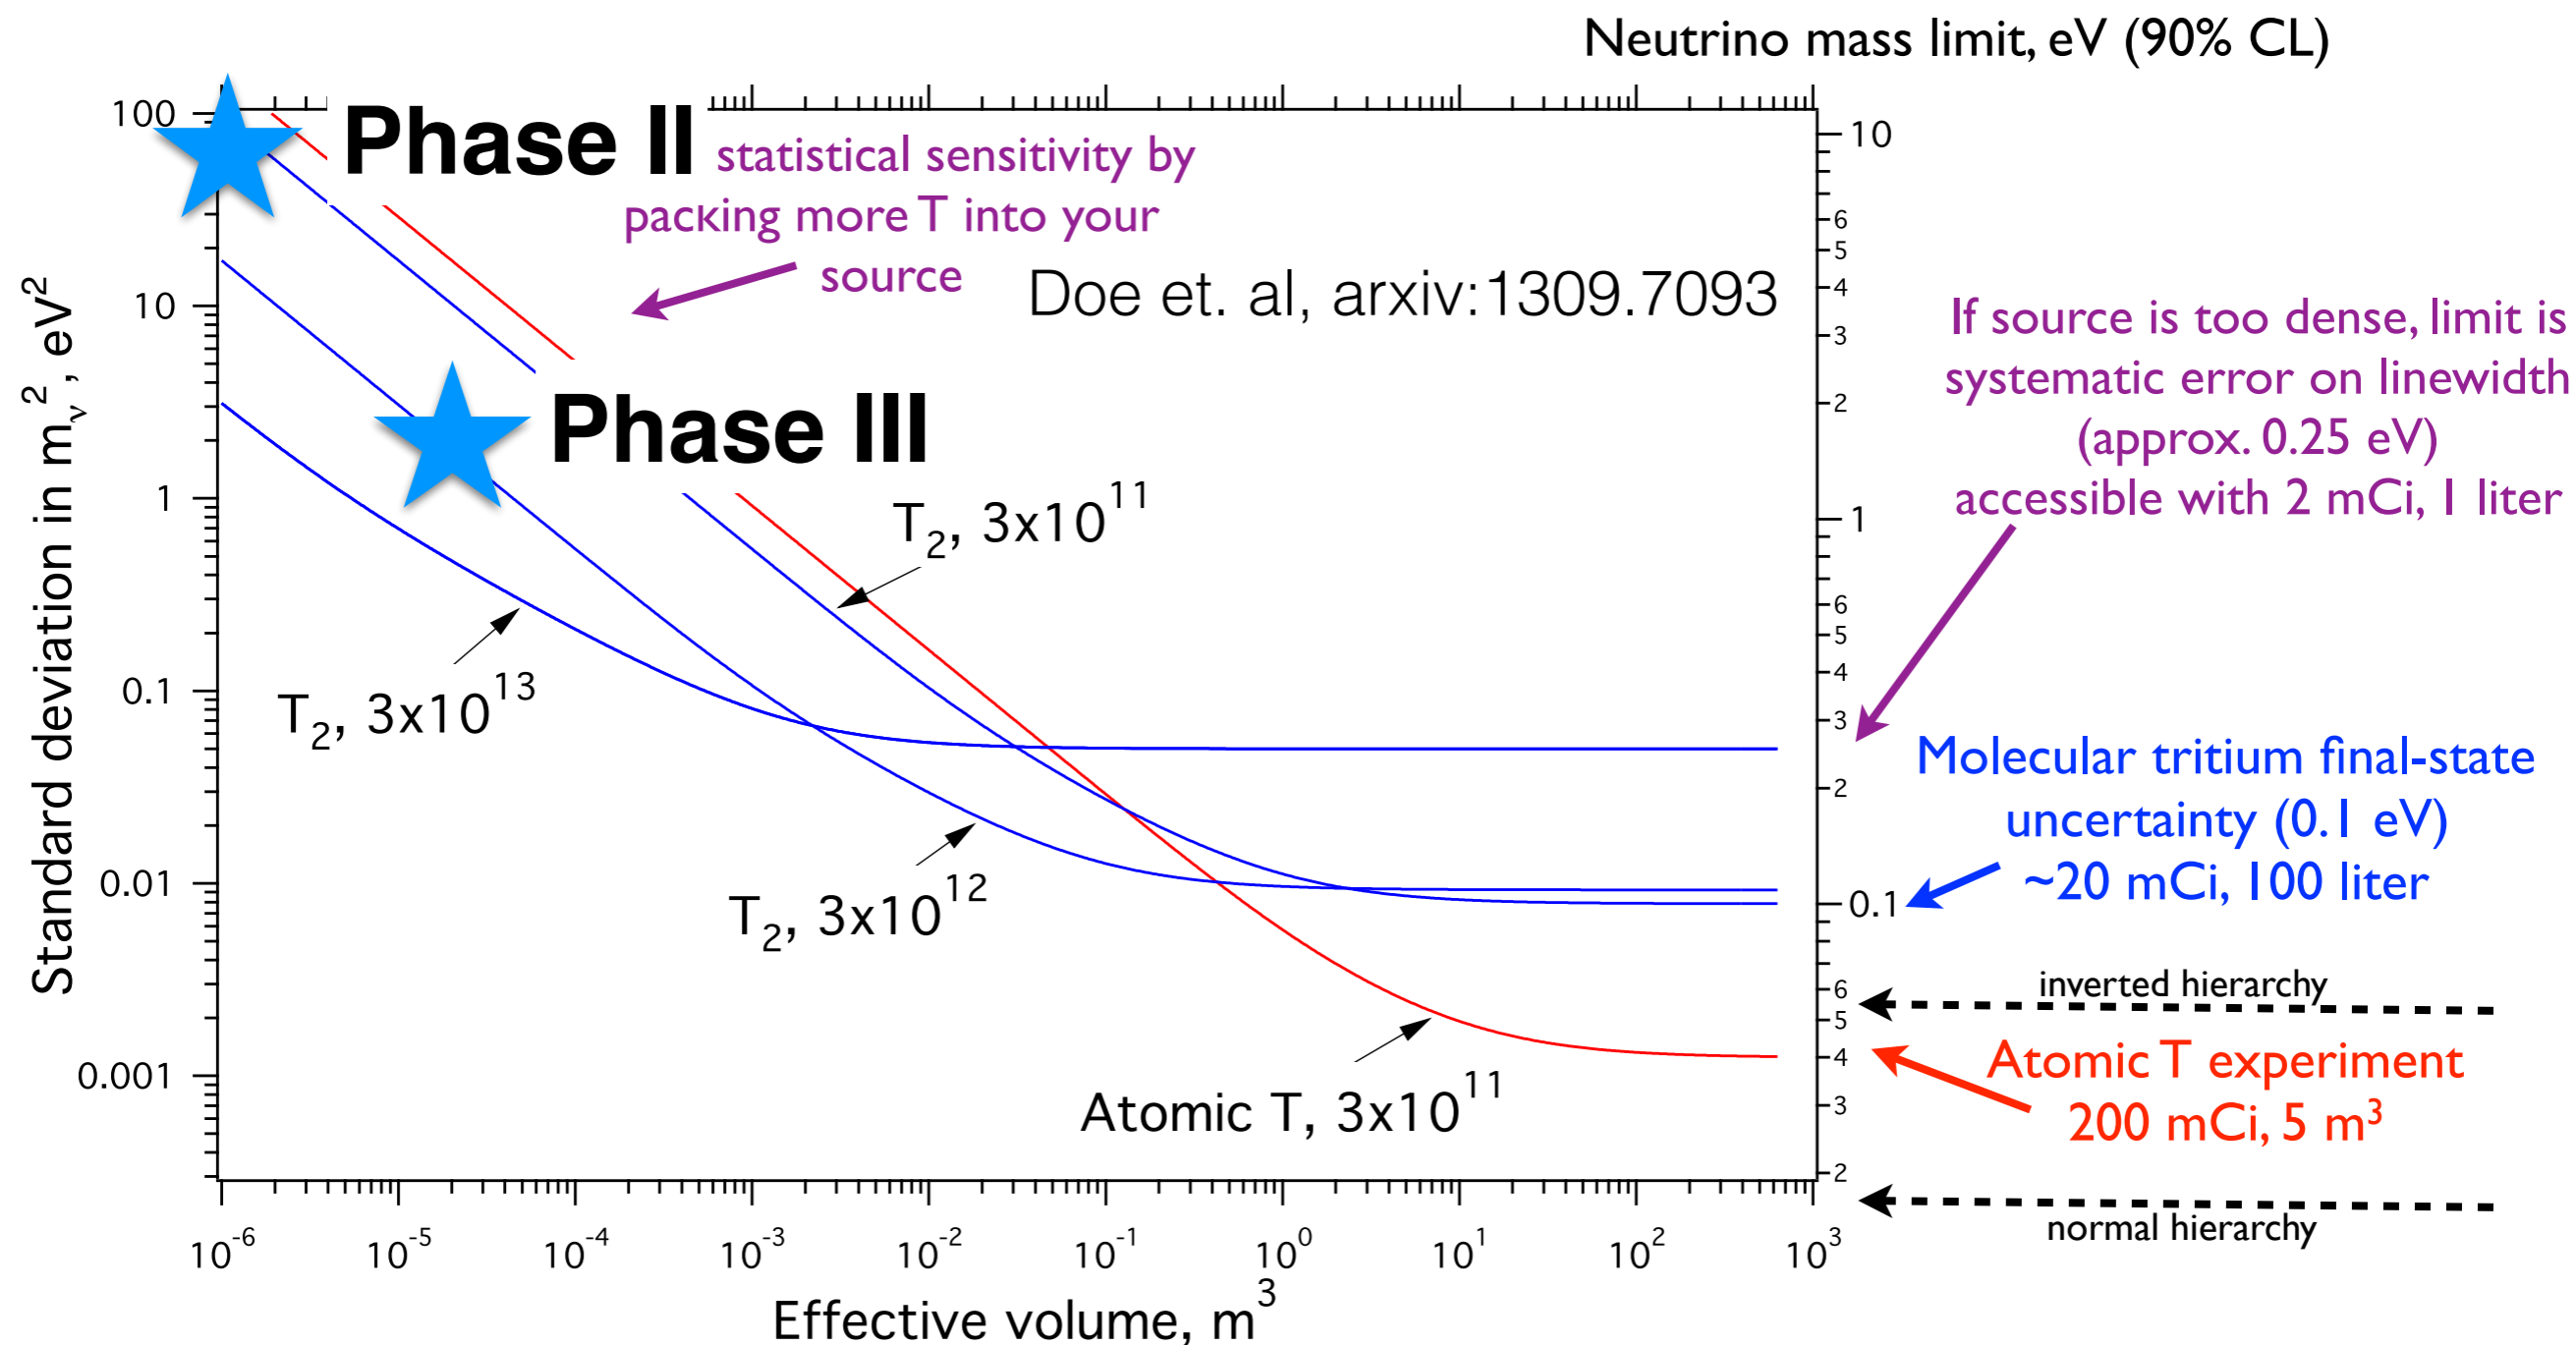

Small and high-density or large and low-density?

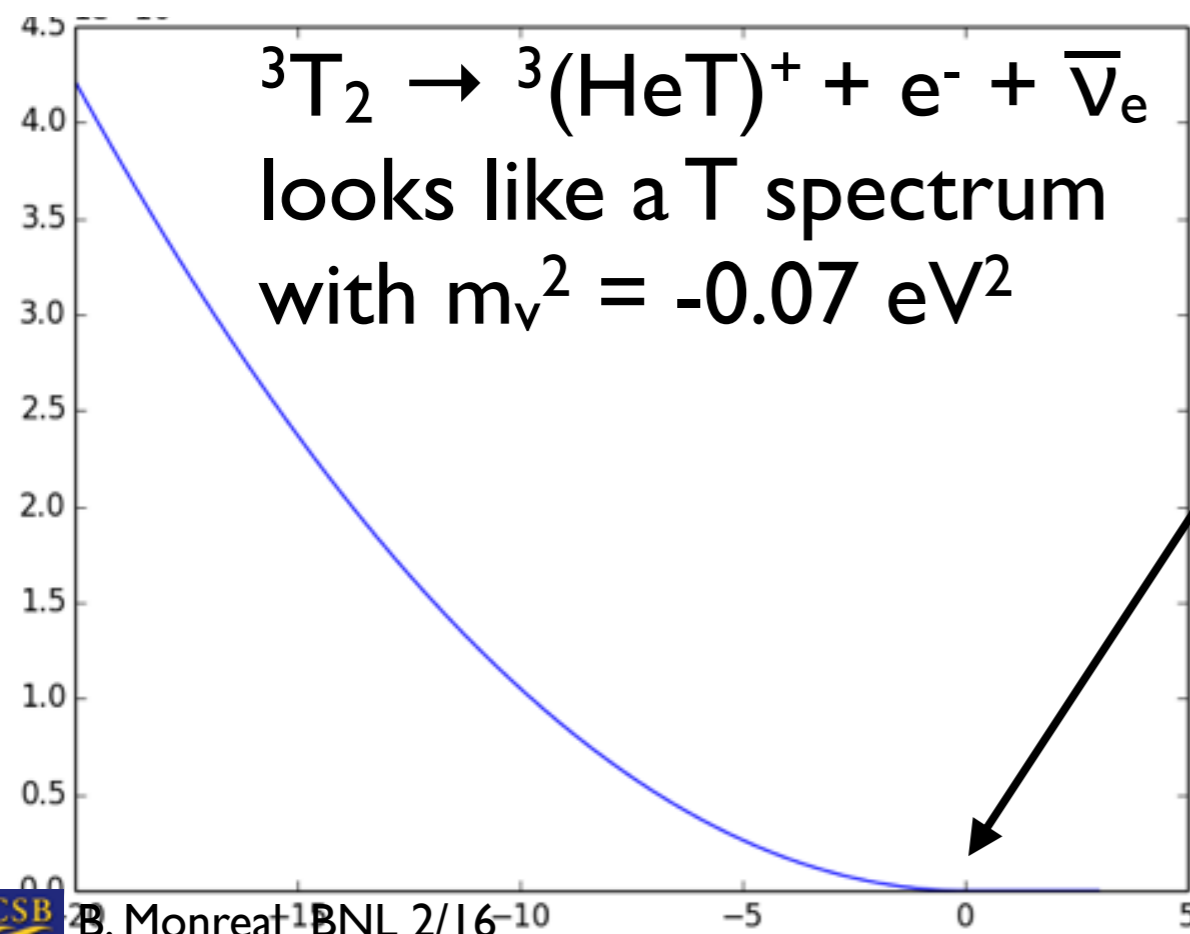

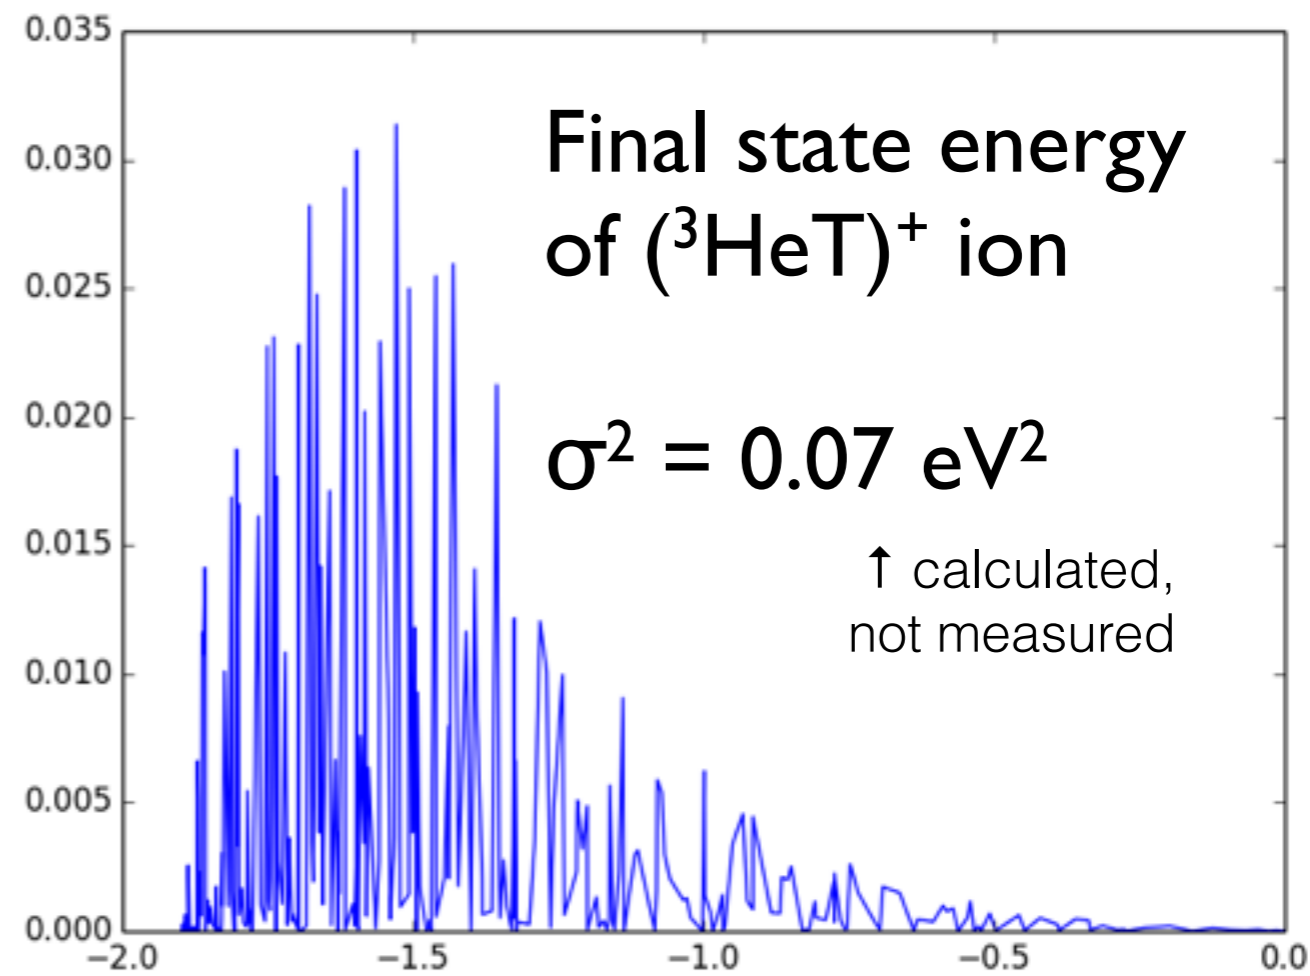

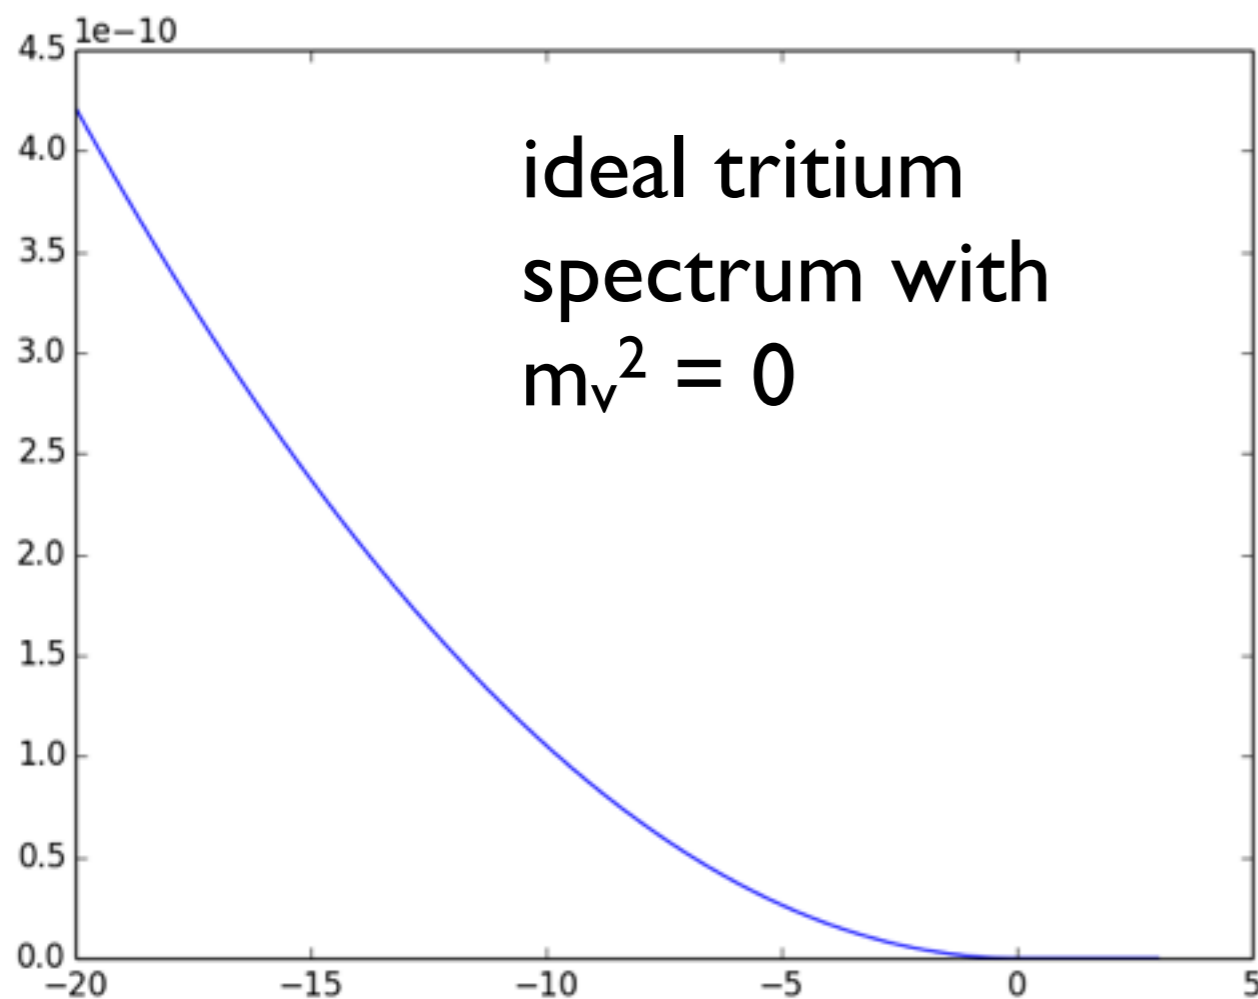

Details: $B=1$ Tesla, background = $1 \mu\text{Hz/eV}$, livetime 1y , angular acceptance 1 ster, pressure broadening known to 1% , field broadening $< 10^{-7}$

Project 8 sensitivity estimates:

Small and high-density or large and low-density?

Details: $B=1$ Tesla, background = $1 \mu\text{Hz/eV}$, livetime 1y, angular acceptance 1 ster, pressure broadening known to 1%, field broadening $< 10^{-7}$

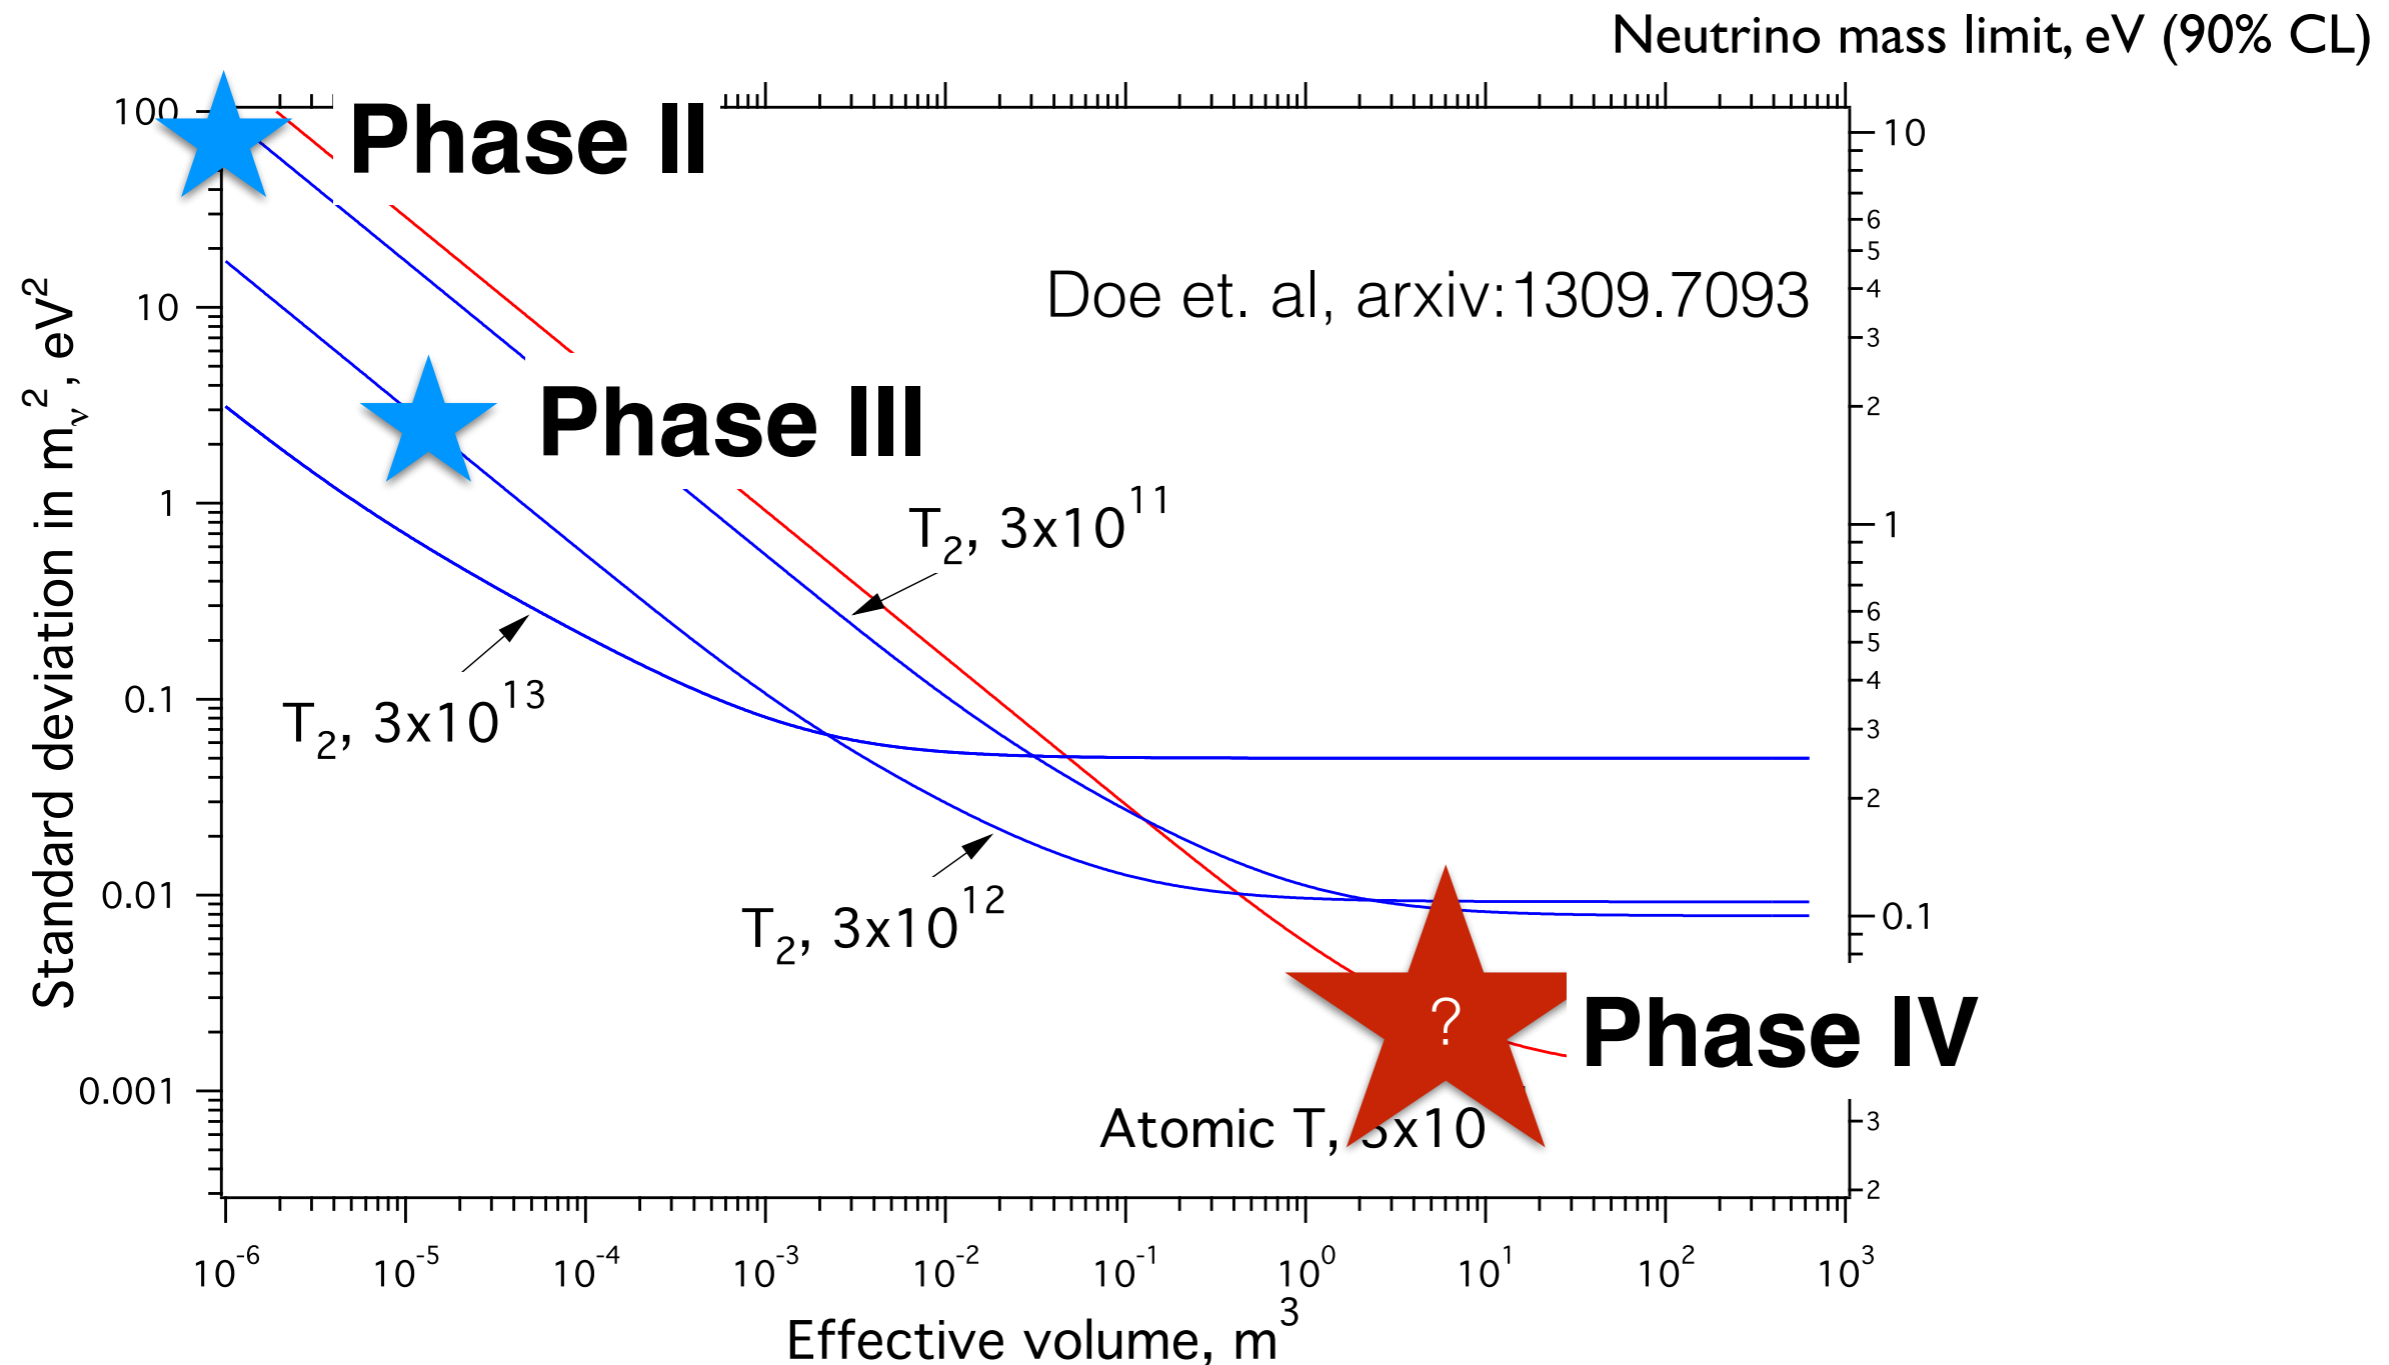

different here,
but usually not
resolvable

- T_2 molecular physics is both blurring and adding systematics
- Worth moving to T_1 source if at all possible

Project 8 sensitivity estimates:

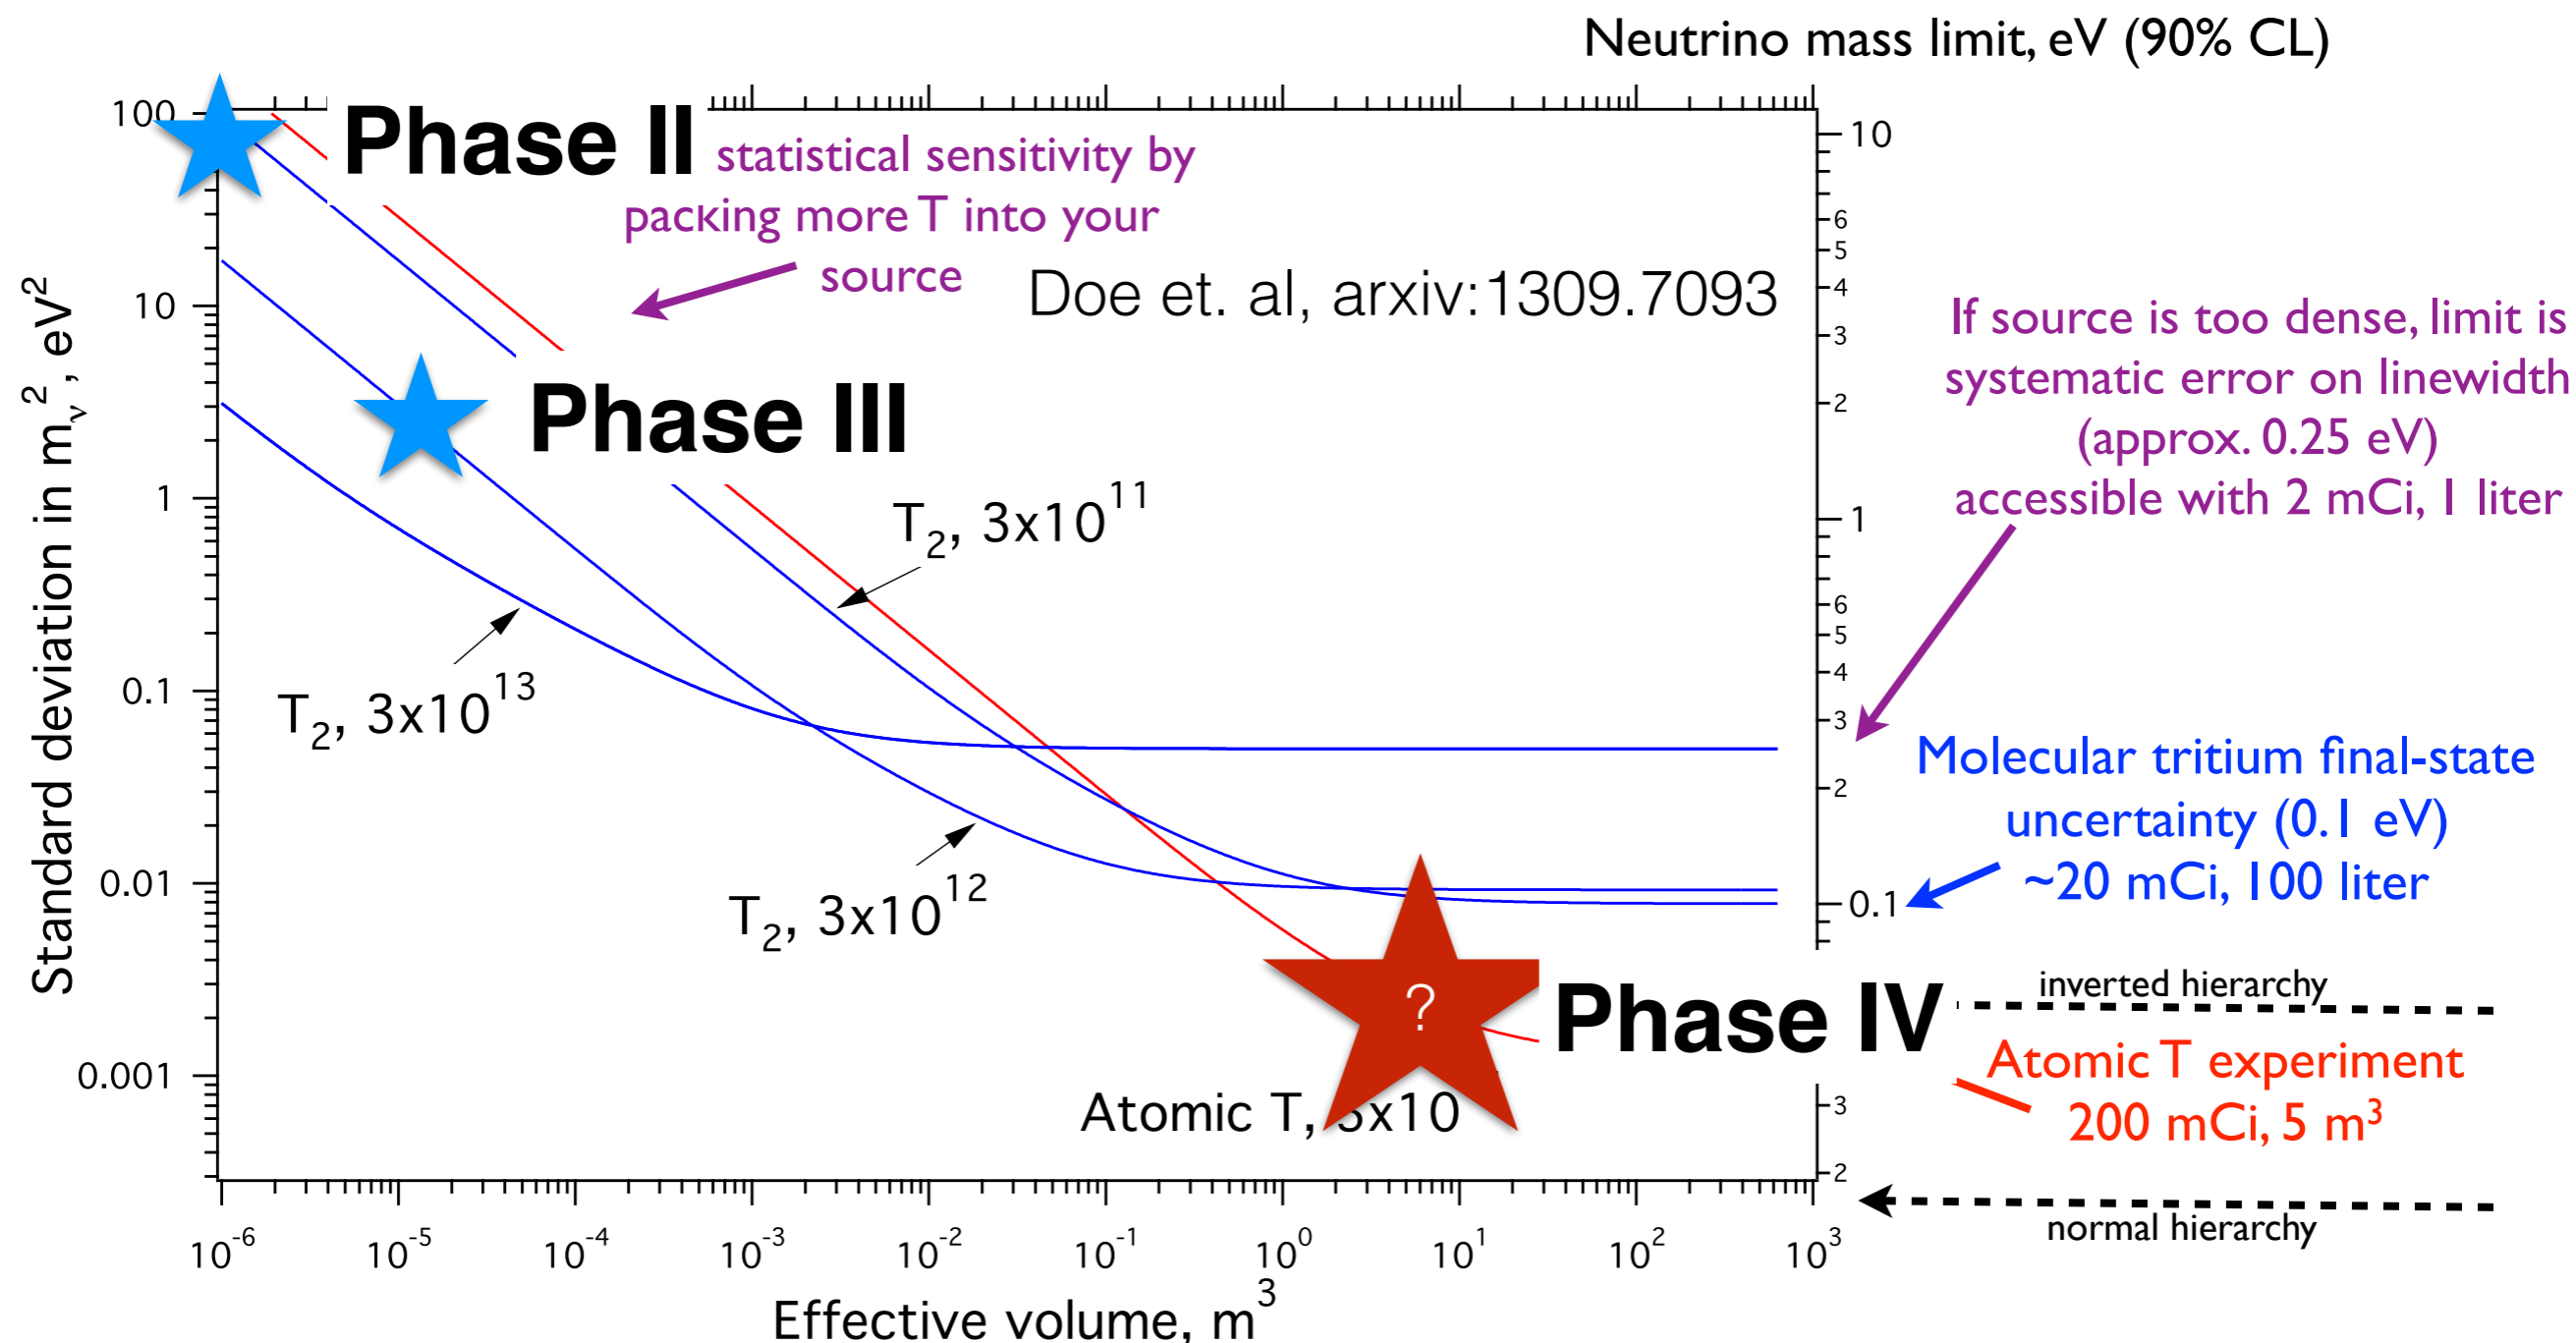

Small and high-density or large and low-density?

Details: B=1 Tesla, background = 1 μ Hz/eV, livetime 1y, angular acceptance 1 ster, pressure broadening known to 1%, field broadening $< 10^{-7}$

Project 8 sensitivity estimates:

Small and high-density or large and low-density?

Details: B=1 Tesla, background = 1 μ Hz/eV, livetime 1y, angular acceptance 1 ster, pressure broadening known to 1%, field broadening $< 10^{-7}$
