CHICAGO

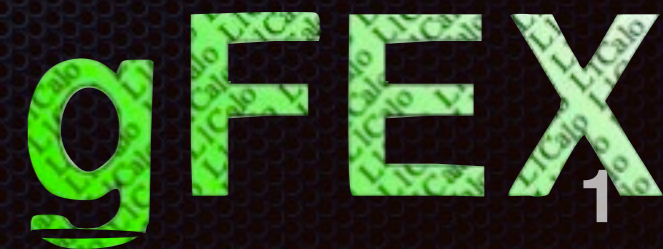

global Feature EXtraction (gFEX)

Giordon Stark, David Miller (advisor)

LUA Talk 2014

November 14th, 2014

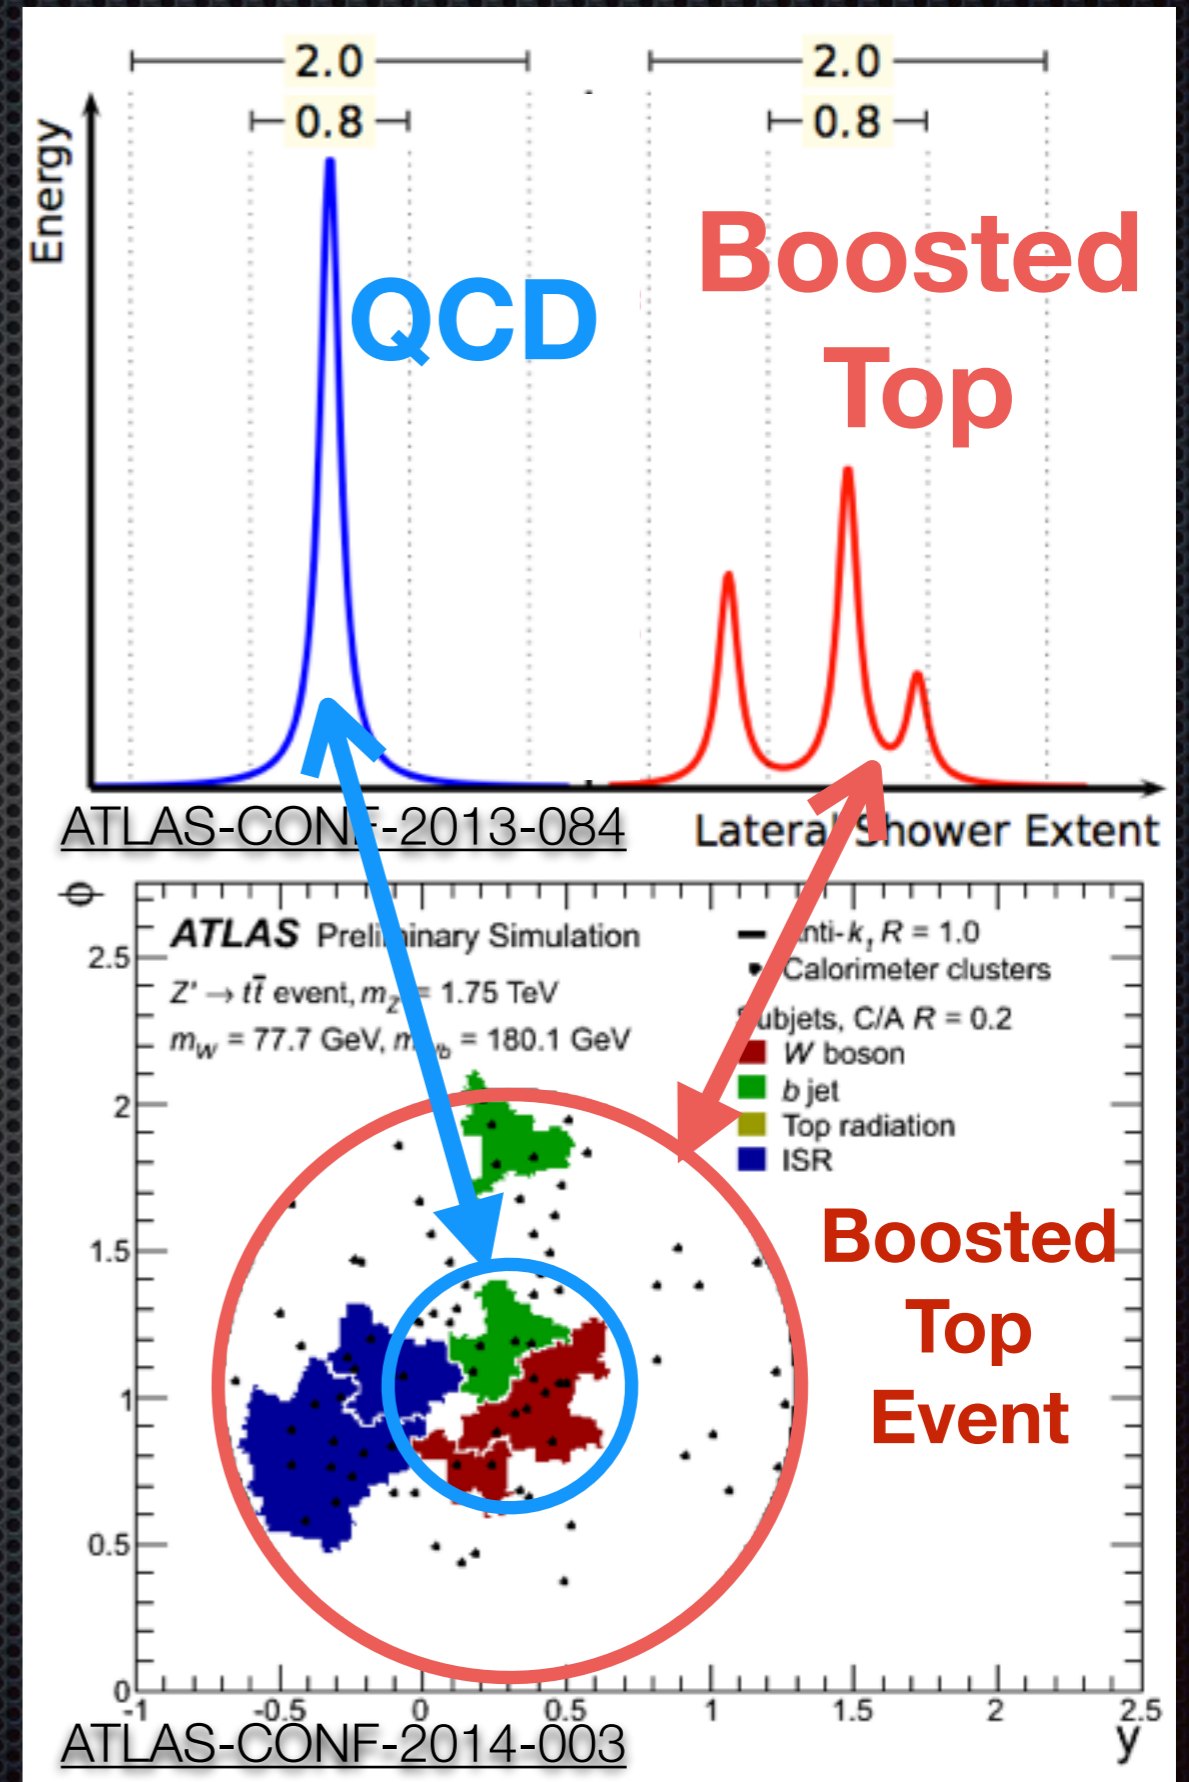

The Motivation

The Motivation

- Boosted objects with substructure are the crux of future ATLAS studies
 - Expect many boosted $W/Z/h$ bosons & tops in LHC Run 2 and beyond

The Motivation

- Boosted objects with substructure are the crux of future ATLAS studies
 - Expect many boosted W/Z/h bosons & tops in LHC Run 2 and beyond
- Current level 1 triggers are
 - **efficient for narrow jets**
 - **inefficient for large-R jets**

The Motivation

- Boosted objects with substructure are the crux of future ATLAS studies
 - Expect many boosted W/Z/h bosons & tops in LHC Run 2 and beyond
- Current level 1 triggers are
 - **efficient for narrow jets**
 - **inefficient for large-R jets**
- Can we increase the trigger region?
 - **not possible with current L1Calo architecture!**

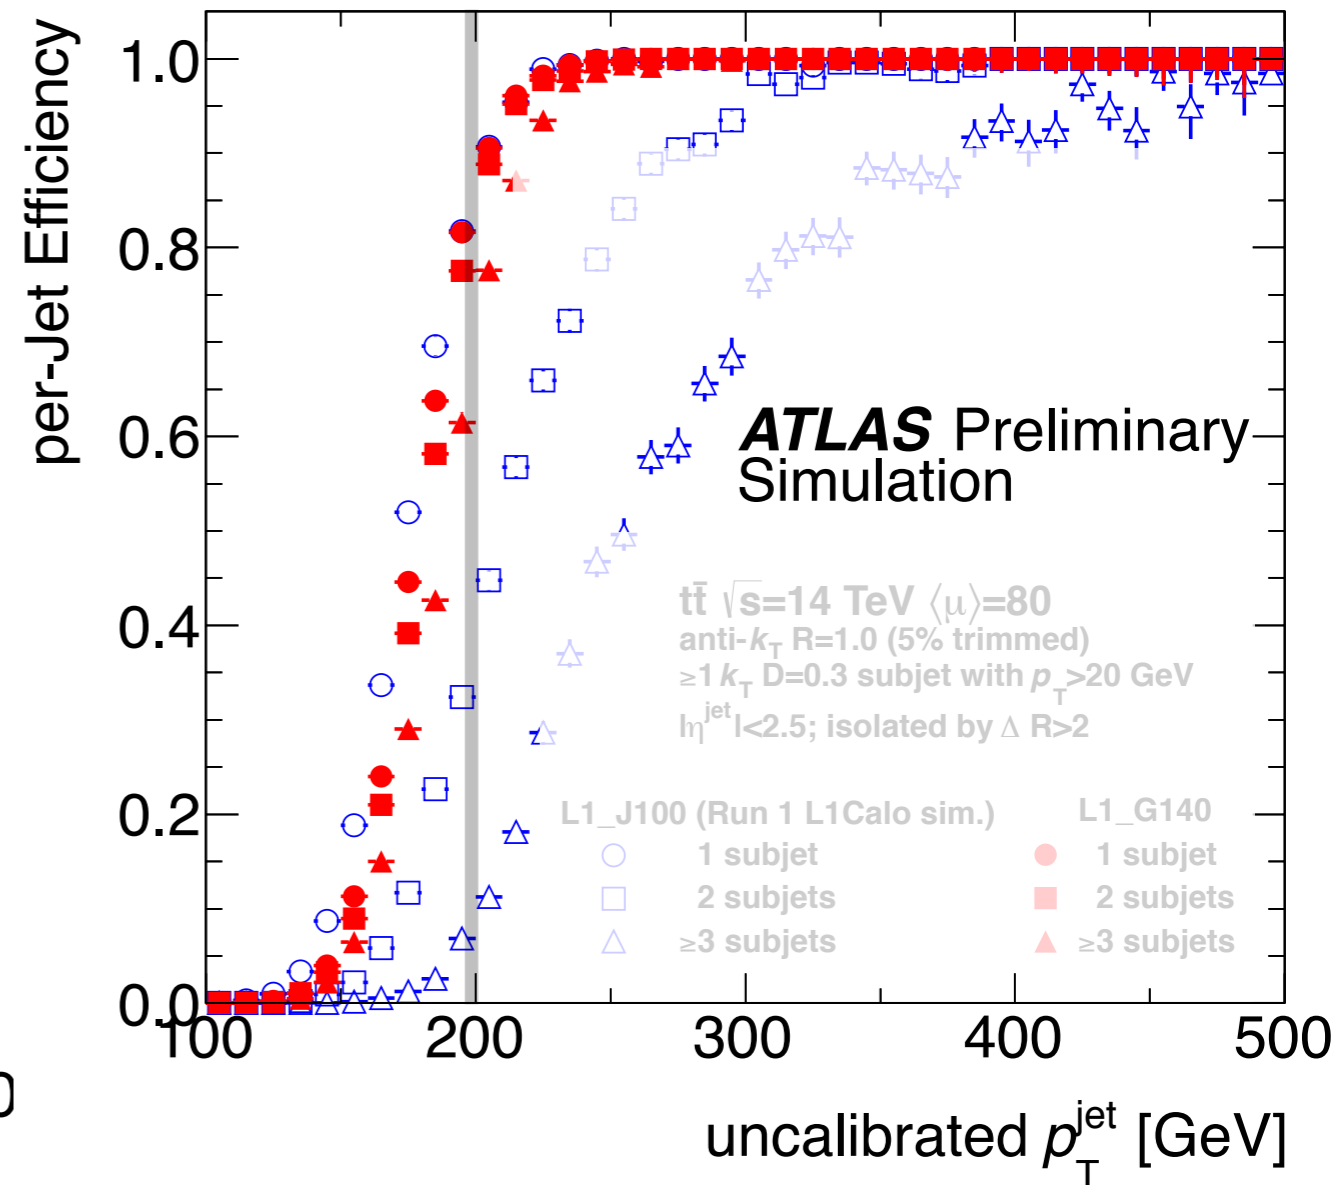

Triggering on Jet Substructure

Triggering on Jet Substructure

Triggering on Jet Substructure

Blue=Current Trigger @ 100 GeV

Red=gFEX Trigger @ 140 GeV

Triggering on Jet Substructure

Blue=Current Trigger @ 100 GeV

Red=gFEX Trigger @ 140 GeV

Current trigger is inefficient for jets with significant substructure

global Feature Extraction

LHC Run 3 — a new feature extraction module

global Feature Extraction

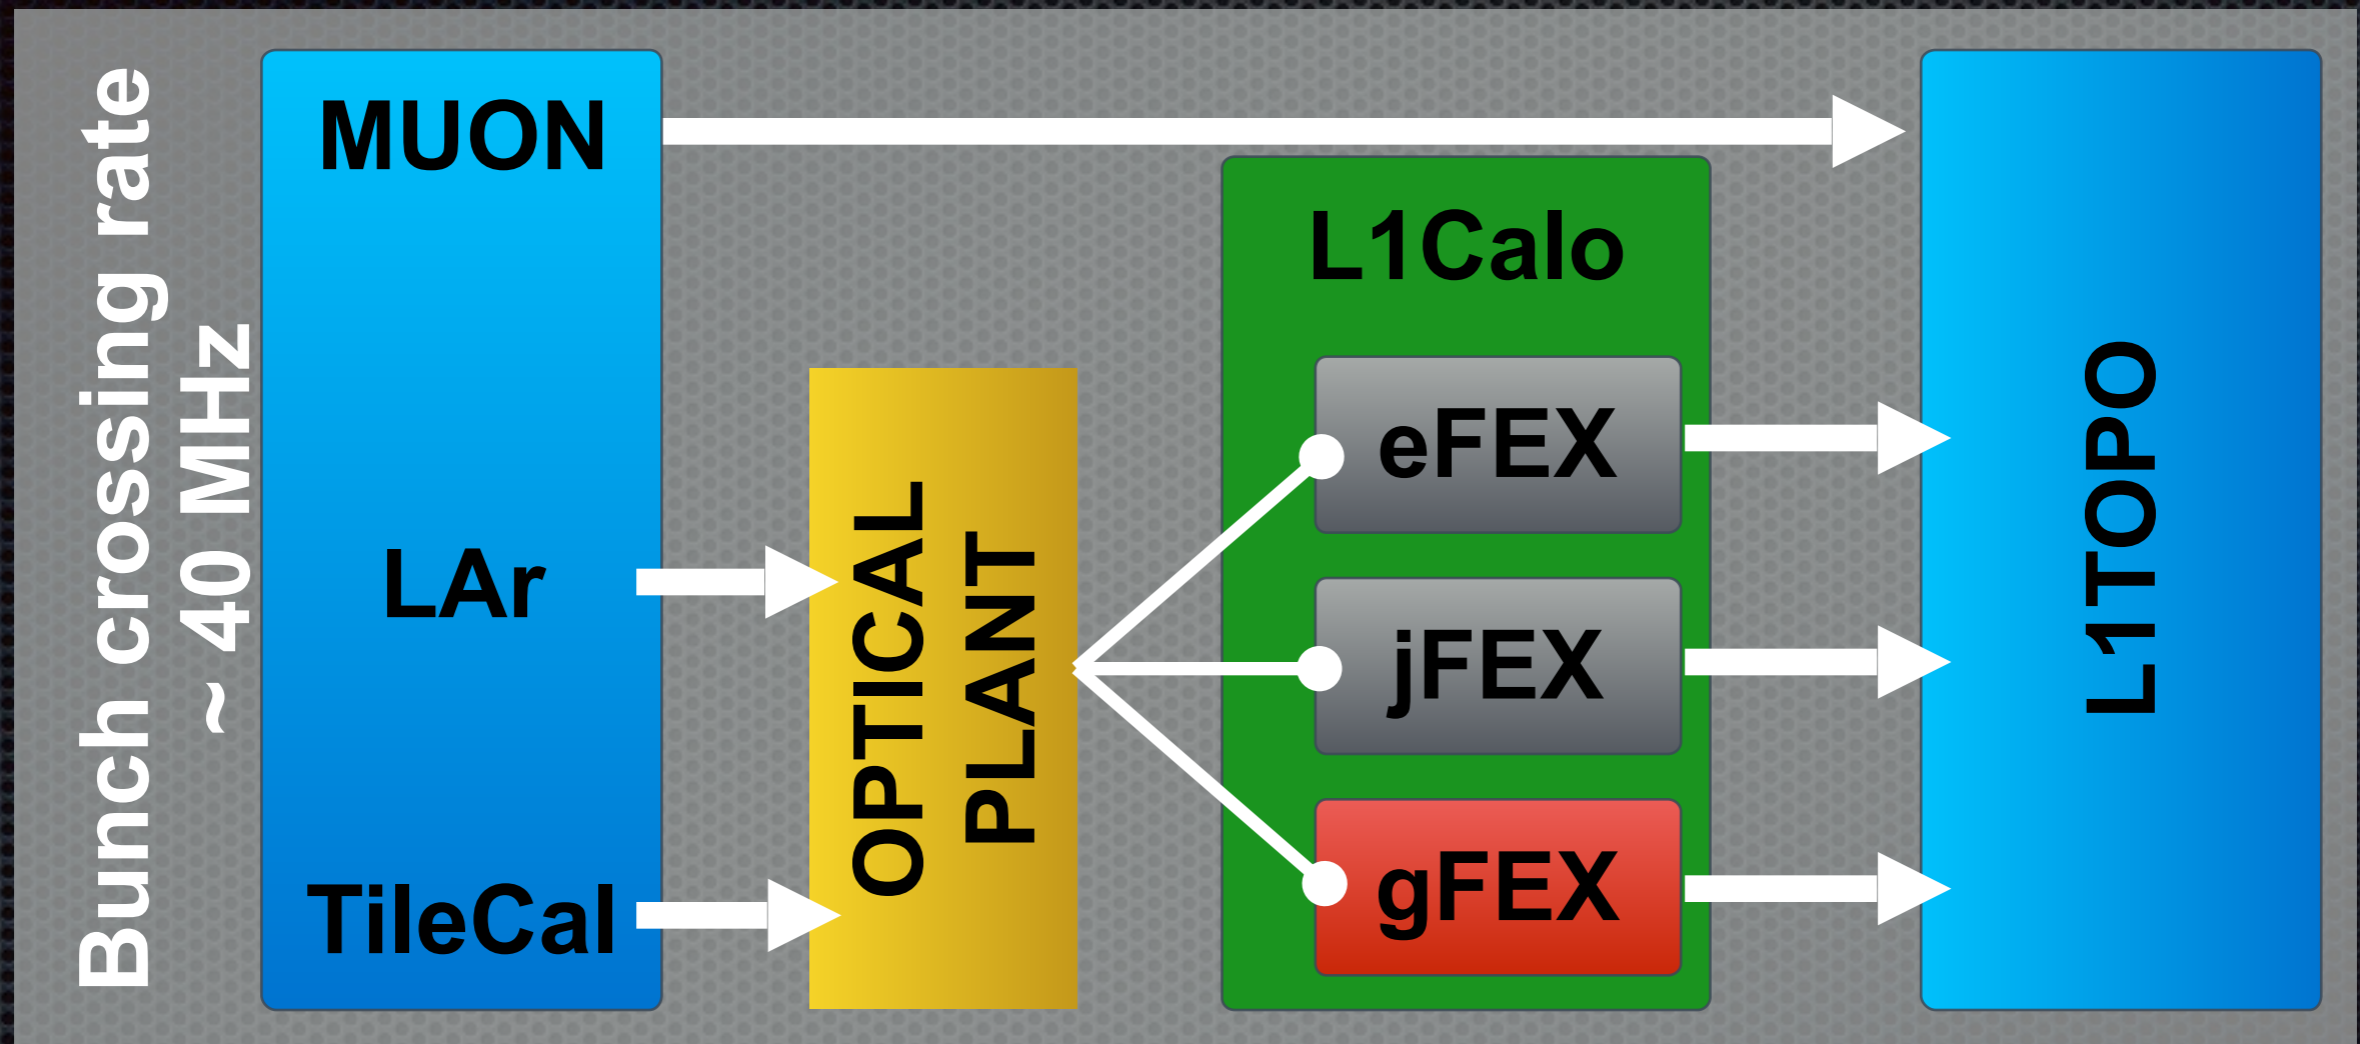

LHC Run 3 — a new feature extraction module

Our Solution: increase the RoI and processing speed, but some loss in angular resolution

global Feature Extraction

LHC Run 3 — a new feature extraction module

Our Solution: increase the RoI and processing speed, but some loss in angular resolution

- algorithms run within 5 bunch crossings (125 ns), not including data input/output

global Feature Extraction

LHC Run 3 — a new feature extraction module

Our Solution: increase the RoI and processing speed, but some loss in angular resolution

- algorithms run within 5 bunch crossings (125 ns), not including data input/output
- L1Topo/HLT get info about jets above a threshold and pileup calculation for other triggers

global Feature Extraction

LHC Run 3 — a new feature extraction module

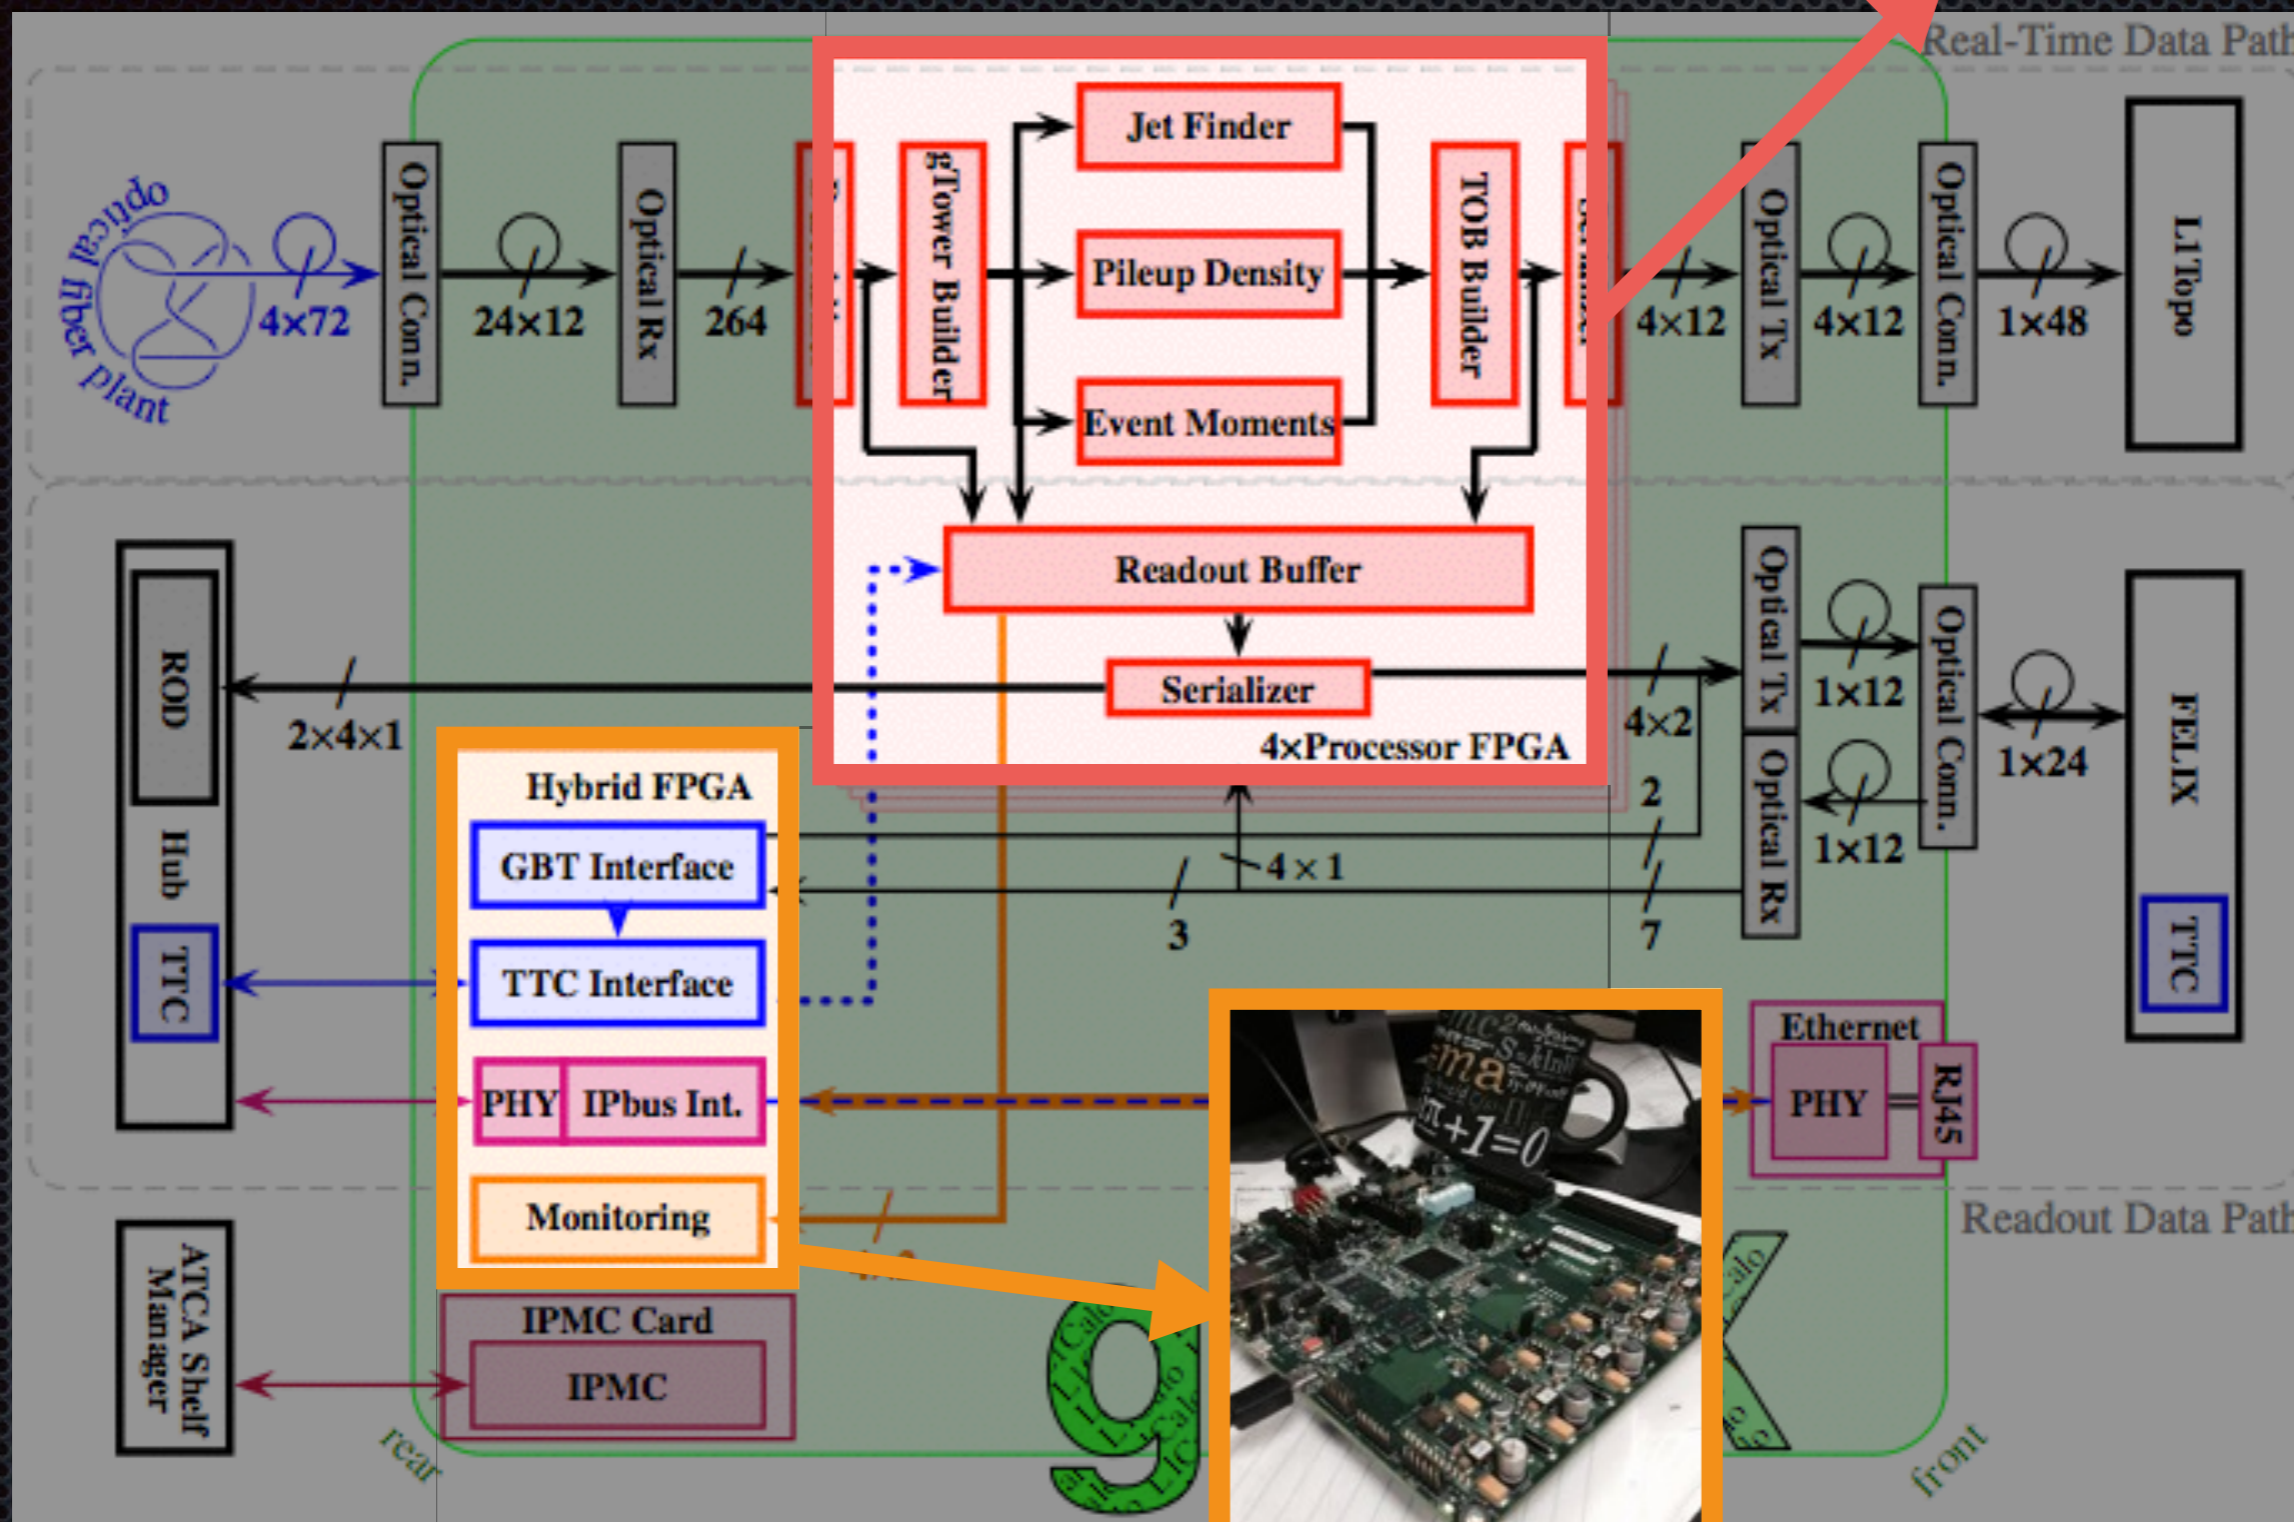

Our Solution: increase the RoI and processing speed, but some loss in angular resolution

- **algorithms run within 5 bunch crossings** (125 ns), not including data input/output
- L1Topo/HLT get info about **jets above a threshold and pileup calculation** for other triggers
- **full calorimeter information on a single board** enables calculation of global event quantities

What's inside?

Algorithms Run On FPGAs

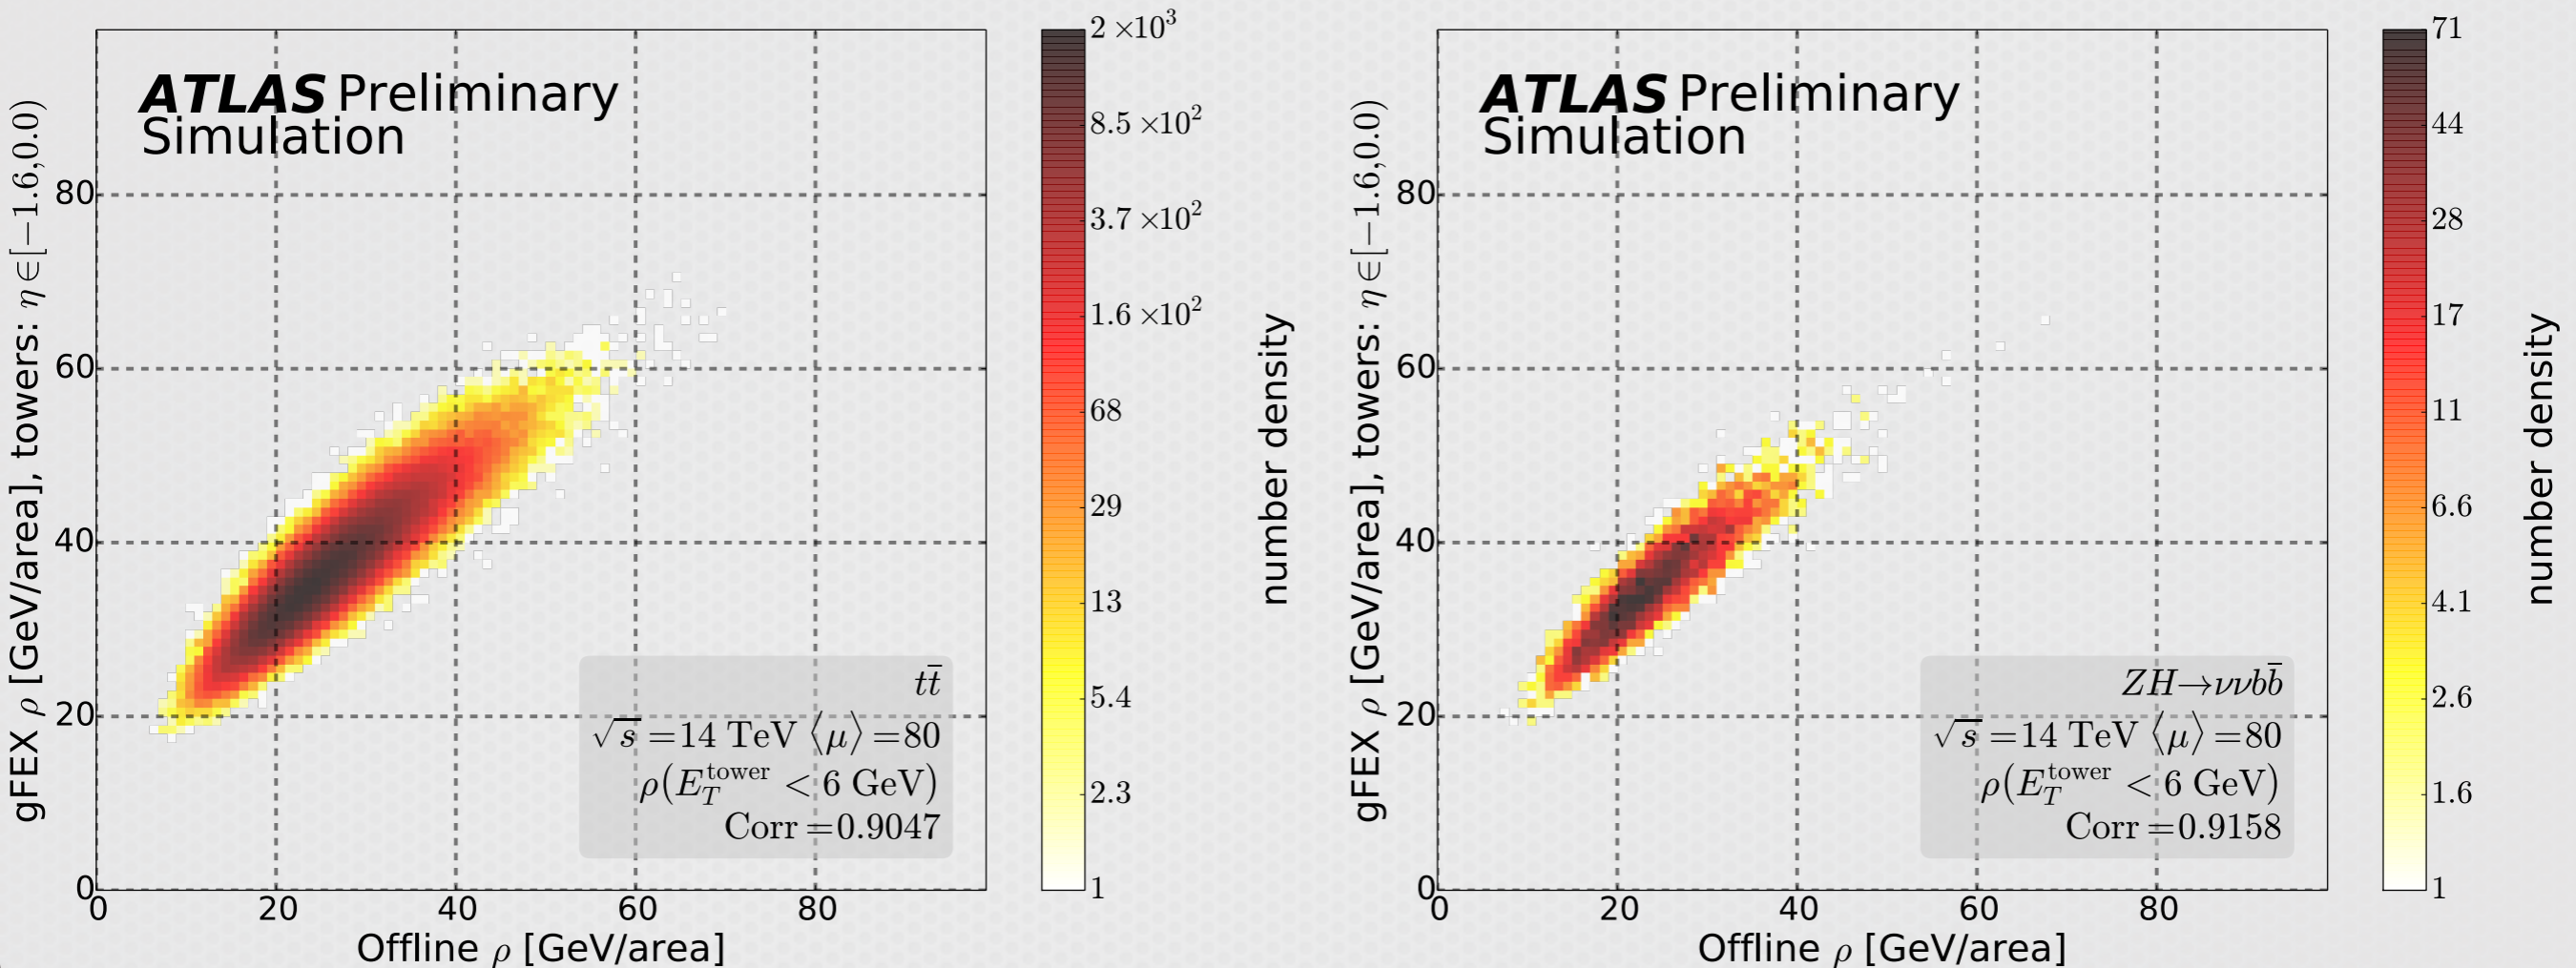

UChicago: Zynq Eval. Board — Slow Control and Monitoring

Pile-up Energy Density Calculations in the gFEX at the Level 1 Trigger

$t\bar{t}$

$ZH \rightarrow \nu\nu b\bar{b}$

How does our simplified calculation of pileup density match up to the corresponding offline calculation?

The pile-up does not depend on the physics processes we're studying.

The Takeaway

The Takeaway

- ✦ **What are we doing?**

- ✦ Building a large-R jet trigger for Run 3 and beyond
- ✦ Estimating pileup for jet-level corrections

The Takeaway

- ✦ **What are we doing?**

- ✦ Building a large-R jet trigger for Run 3 and beyond
- ✦ Estimating pileup for jet-level corrections

- ✦ **Why are we doing it?**

- ✦ We expect to see more jets with substructure in the future

The Takeaway

- ✦ **What are we doing?**

- ✦ Building a large-R jet trigger for Run 3 and beyond
- ✦ Estimating pileup for jet-level corrections

- ✦ **Why are we doing it?**

- ✦ We expect to see more jets with substructure in the future

- ✦ **What makes gFEX special?**

- ✦ Full calorimeter on a single board
- ✦ Maintains trigger efficiency for various jet substructures
- ✦ **[ongoing]** 0.2×0.2 ($\eta \times \phi$) tower region can be used as a proxy for subjets
