The MINERvA detector construction database

Wednesday, 5 August 2009 09:20 (20 minutes)

We describe the construction database for the MINERvA detector. MINERvA is a low-mass fully active neutrino detector that is designed to study low-energy neutrino interactions. The detector database keeps track of all detector components, illustrates the relationship between different detector elements, simplifies future data entry and record maintenance. The database is written in Structured Query Language (MySQL). A Python graphical user interface for the database is being developed.
