Neutrinos and Dark Matter in the minimal $B - L$ SUSY Model

Tuesday, August 30, 2011 2:30 PM (20 minutes)

We analyze the inclusion of the neutrinos in the MSSM by gauging them under $U(1)_{B-L}$. We then solve the RGE in order to find the sparticle mass spectrum and the breaking scale of $U(1)_{B-L}$. We also study the possibility to generate neutrino masses due to a double see-saw mechanism, which is naturally implemented on this ground, and perform an analysis to determine the DM relic density generated within the model.
