The Higgs 'Golden Channel' at 7 TeV

Monday, 29 August 2011 15:50 (20 minutes)

We perform a study of the expected significance of a Standard Model Higgs Boson signal at a 7 TeV LHC. Specifically we examine the $H \rightarrow ZZ \rightarrow l+l+l+l$ "Golden Channel" for a Higgs mass range of 175-350 GeV at various luminosities. We also examine exclusion limits should a signal not be seen.

Presenter: VEGA MORALES, Roberto (Northwestern University)
