MSSM Electroweak Sector: Collider Studies and Phenomenological Implications

Monday, 29 August 2011 14:30 (30 minutes)

Given the current results on the Supersymmetry searches at the LHC, we explore scenarios in which the only accessible SUSY states are the electroweak sector: neutralinos, charginos and sleptons. We study the process where those electroweak interacting particles are directly produced and analyze the possible reaches at the LHC.

Presenter: Prof. SU, Shufang (University of Arizona)

Session Classification: Parallel Session 4
