A dark force for hadrons

Tuesday, 30 August 2011 12:35 (25 minutes)

We suggest the existence of a fundamental connection between baryonic and dark matter. This is motivated by both the stability of these two types of matter as well as the observed similarity of their present-day densities. A unified genesis of baryonic and dark matter arises naturally in models in which the baryon number is promoted to a spontaneously broken local gauge symmetry while the lepton number is explicitly violated. This is illustrated in a specific class of SUSY models using the Affleck-Dine mechanism. The dark matter candidate in these scenarios is charged under the baryon gauge symmetry and is required to have a mass at the GeV scale. We discuss the collider constraints from B-factories, the LEP and Tevatron experiments, as well as direct detection bounds. A baryonic dark force is shown to be consistent for all data for mediators as light as the GeV scale.
