Zeroing in on Supersymmetric Radiation Amplitude Zeros

Tuesday, 30 August 2011 15:45 (25 minutes)

Radiation amplitude zeros have long been used to test the Standard Model. Here, we consider the potential supersymmetric radiation amplitude zero in chargino-neutralino production, as could be seen at the upgraded LHC. We use the trilepton decay channel to investigate the wino content of the neutralino. Using a scan over the 19-dimensional parameter space of the phenomenological MSSM, we demonstrate how searches for radiation amplitude zeros can complement other methods of determining the neutralino mixing matrix.

Presenter: Mr ISMAIL, Ahmed (SLAC)

Session Classification: Parallel Session 6
