Composite Scalars with a Compact Extra Dimension

Sunday, 28 August 2011 11:55 (20 minutes)

We study the low-energy effects of a 4 fermion operator in a 5-dimensional space-time with a single compactified extra dimension. Quantum effects due to fermion loops renormalize the theory, and lead to dynamical scalar degrees of freedom which can be considered to be bound states of 5-dimensional fermions. For critical values of the 4-fermion coupling, these bound states can condense, breaking the chiral symmetries of the theory. We consider application to extradimensional models of electroweak symmetry breaking.

Presenter: Mr BUNK, Don (Syracuse University)

Session Classification: Parallel Session 1
