## Leptogenesis in a SUSY Left-Right Model with Inverse Seesaw

*Wednesday, 31 August 2011 15:40 (25 minutes)*

We discuss leptogenesis within a TeV-scale SUSY Left Right model with inverse seesaw for neutrino masses. Contrary to the conventional TeV-scale type-I gauged seesaw, the constraints on the extra gauge bosons in these models are rather weak and allow the  $W_R$  and  $Z'$  mass in the LHC accessible range.
