

DOE Award # DE-SC0001331:
**Sampling Approaches for Multi-Domain Internet
Performance Measurement**

PI: Prasad Calyam, Ph.D.
pcalyam@osc.edu

Project Website: http://www.oar.net/initiatives/research/projects/multidomain_sampling

Progress Report
October 25, 2010

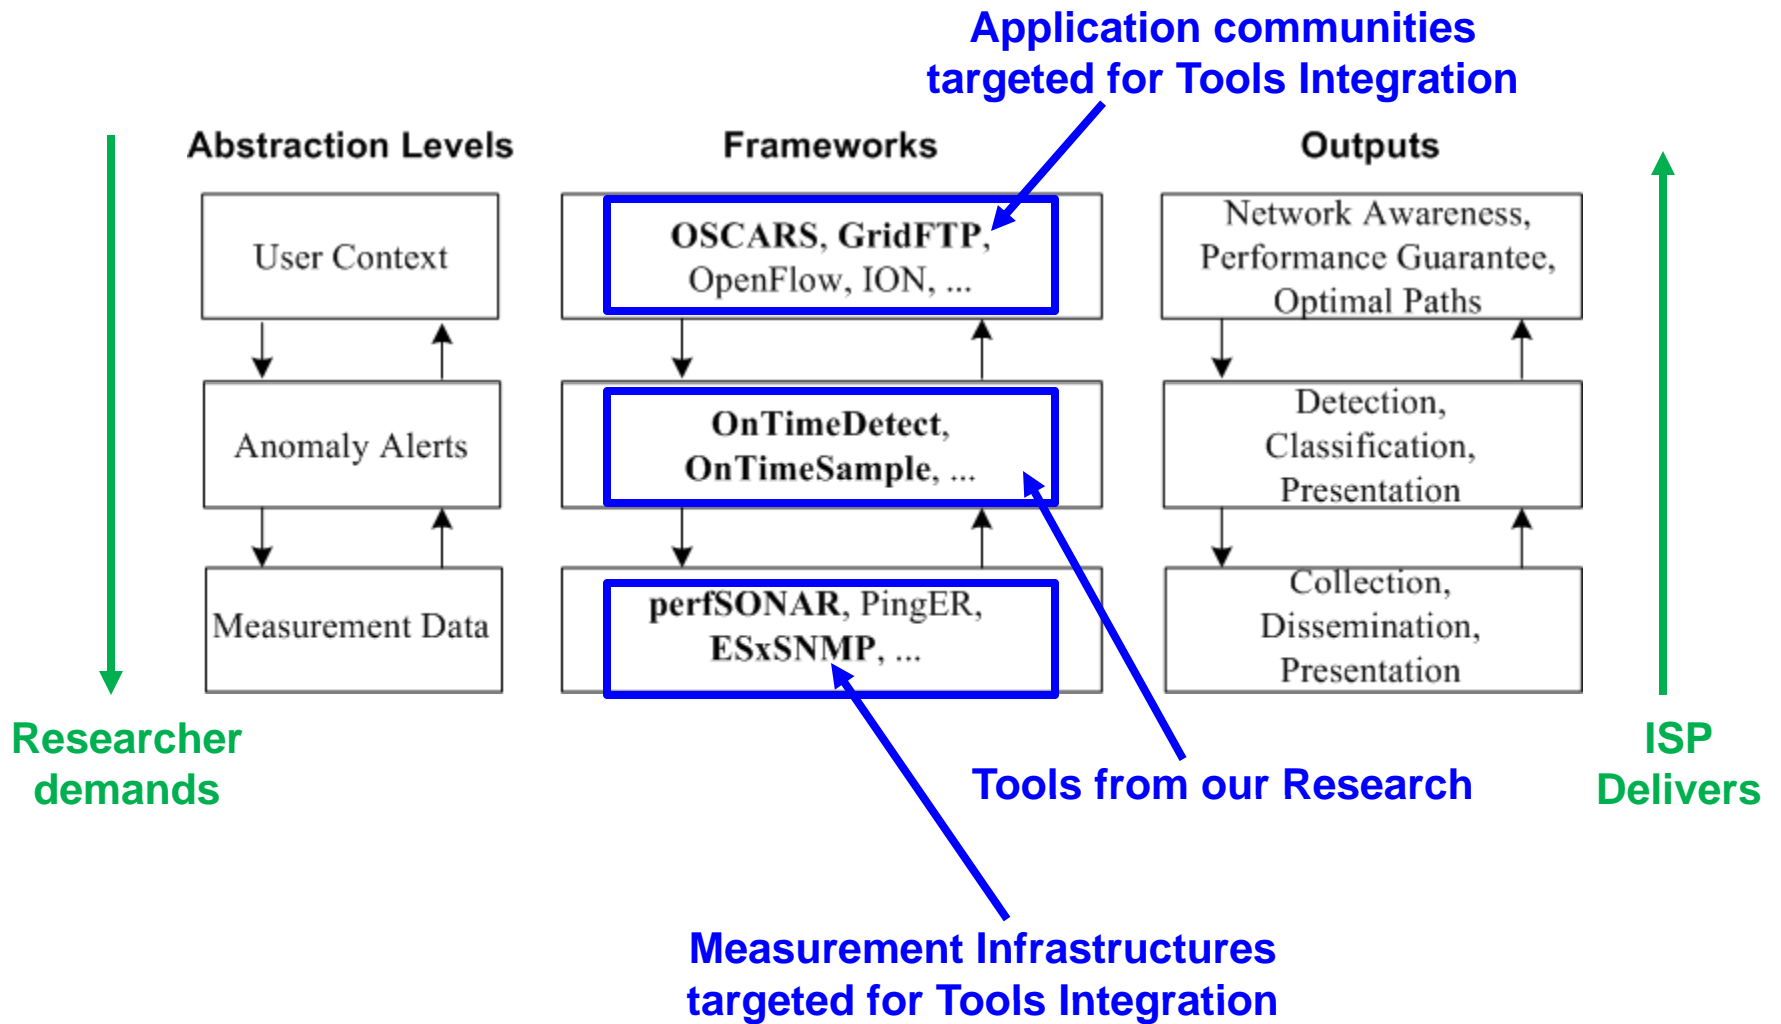

Topics of Discussion

- Project Overview
- Workplan Status
- Accomplishments
 - Part I: perfSONAR Deployments' Measurements Analysis
 - Major Activities, Results and Findings
 - Part II: Multi-domain Measurement Scheduling Algorithms
 - Major Activities, Results and Findings
 - Part III: Outreach and Collaborations
- Planned Next Steps

Project Overview

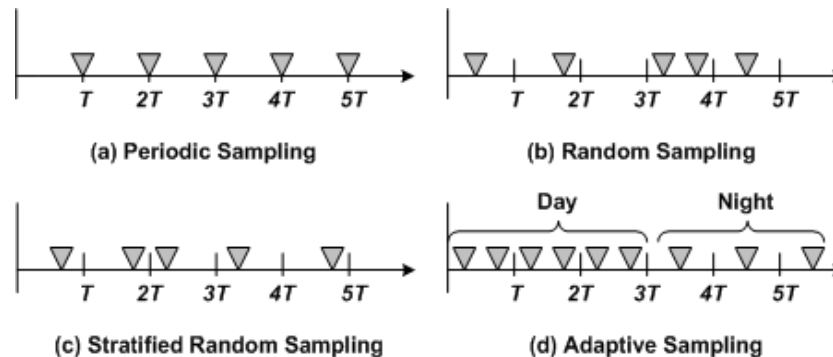

- DOE ASCR Network Research Grant
 - PI: Prasad Calyam, Ph.D.
 - Team: Mukundan Sridharan (Software Engineer), Lakshmi Kumaraswamy (Graduate Research Assistant), Pu Jialu (Undergraduate Research Assistant), Thomas Bitterman (Software Engineering Consultant)
- Goal: To develop *multi-domain* network status sampling techniques and tools to measure/analyze multi-layer performance
 - To be deployed on testbeds to support networking for DOE science
 - E.g., perfSONAR deployments for E-Center network monitoring, Tier-1 to Tier-2 LHC sites consuming data feeds from CERN (Tier-0)
- Collaborations: LBNL, FermiLab, Bucknell U., Internet2
- Expected Outcomes:
 - Enhanced scheduling algorithms and tools to sample multi-domain and multi-layer network status with active/passive measurements
 - Algorithms validation with measurement analysis tools for network weather forecasting, anomaly detection, fault-diagnosis

Context of our Research

Sampling and Analysis Requirements

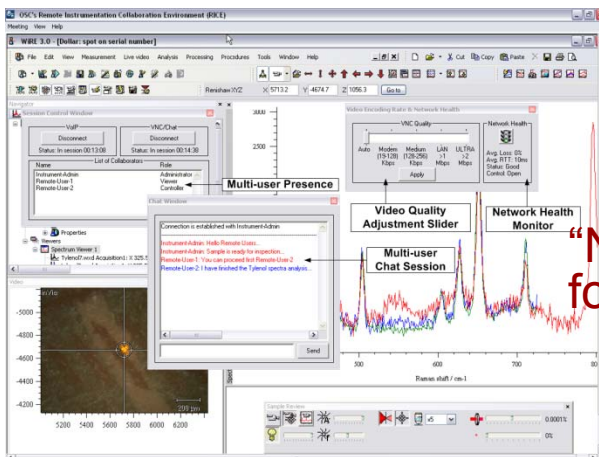

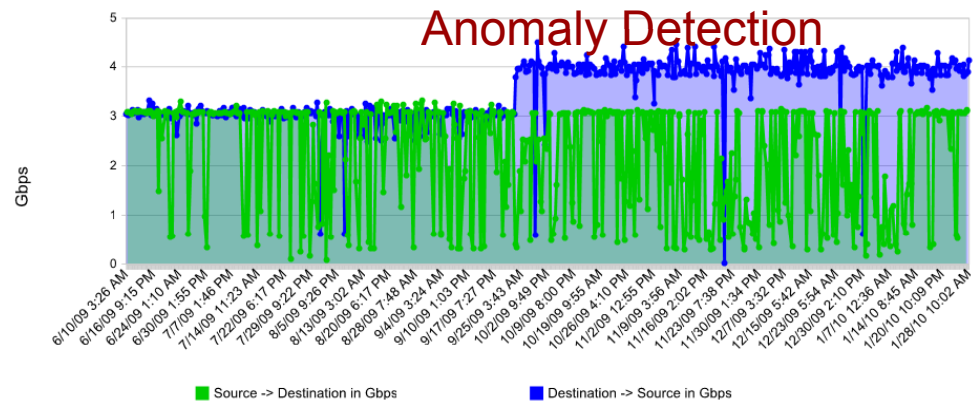

- Applications need *precisely timed* measurements across multiple network domains for analysis and consequent adaptation
 - Ongoing Measurement Requirement
 - Strict periodicity for network weather forecasting
 - Frequent random (e.g., poisson) sampling for anomaly detection
 - Stratified random sampling for routine network monitoring
 - Adaptive sampling to regulate probing bandwidth and measurement storage

Sampling time interval pattern chosen depends on the monitoring accuracy objectives (i.e., pattern should produce least variance between actual and estimated)

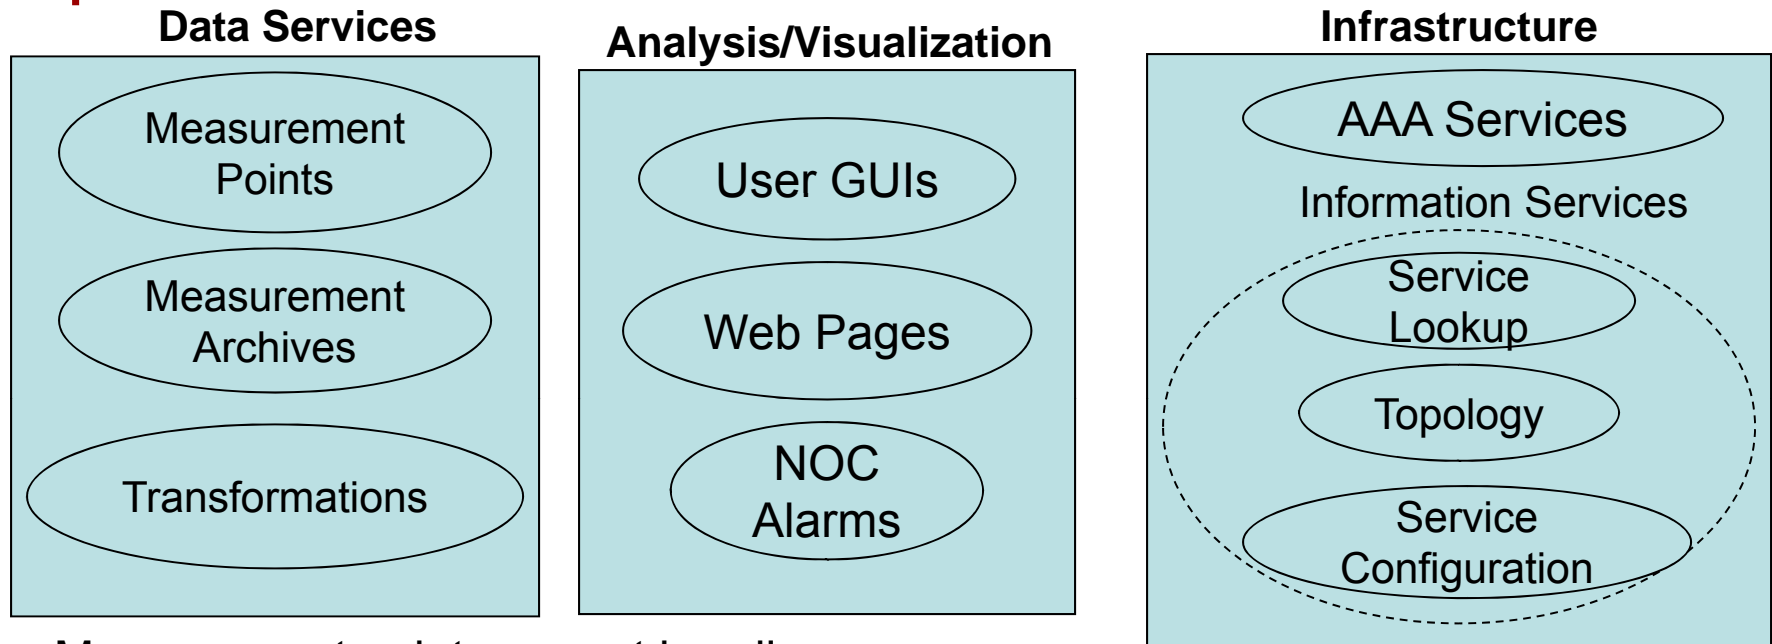

- On-demand Measurement Requirement
 - One-off measurements with quick response times for e.g., to traceback a DDoS attack in a network segment

Examples to show Inter-sampling timing needs

**“Network-awareness”
for Real-time Control**

perfSONAR Architecture and some Limitations

- Measurement points cannot handle diverse sampling requirements
 - Full mesh periodic and best-effort on-demand measurements only
- Meta-scheduler to control measurement points is not developed
 - Current set of 3 tools (Ping, Traceroute, Iperf) will conflict if another tool is added (e.g., pchar)
 - Policies for regulation and semantic priorities cannot be enforced
- Measurement archives have large data sets but lack automated analysis techniques and tools
 - Anomaly detection and notification, weather forecasting, and automated fault diagnosis tools are needed along with easy-to-use GUIs
 - Integration with other measurement frameworks for important events correlation needs improvement

Measurement Conflict Resolution in perfSONAR

The screenshot displays the 'Scheduled Tests Configuration Tool' interface in a web browser. The browser's address bar shows the URL `https://lab236.internet2.edu/toolkit/admin/regular_testing/`. The page title is 'pS-Performance Node - Scheduled Tests Configuration Tool'. The interface includes a sidebar with navigation menus for 'User Tools', 'Service Graphs', 'Toolkit Administration', and 'Performance Toolkit'. The main content area is titled 'Scheduled Tests Configuration Tool' and contains a table of 'Scheduled Tests' with one entry: 'OWAMP Test' with a 'One-Way Delay Test' type and 'Configure Delete' links. Below the table are buttons for 'Add New Throughput Test', 'Add New Ping Test', and 'Add New One-Way Delay Test', along with a 'Configure OWAMP Tests Port Range' button. A warning dialog box is overlaid on the page, stating: 'Warning: host isn't configured for throughput tests'. The message continues: 'Latency tests are configured. Adding throughput tests will make the latency test results meaningless'. The dialog box has two buttons: 'Add Test Anyway' and 'Cancel'.

Workplan Status

Phase		Timeline

IV	Measurement Level Agreement Policies		█			█		█	
V	Measurement Framework Development			█		█		█	
VI	Measurement Framework Deployment & User Support			█		█		█	
VII	Outreach – talks, demos, papers		█			█		█	

Progress and Accomplishments Summary

- Conducted the “first” study to analyze worldwide perfSONAR measurements (480 paths, 65 sites) to detect network anomaly events
 - Developed an adaptive anomaly detection algorithm that is more accurate than existing static schemes (e.g., NLANR/SLAC plateau detector)
 - Demonstrated how a novel adaptive sampling scheme can reduce anomaly detection times from several days to only a few hours in perfSONAR deployments
 - Paper with results published in 2010 IEEE MASCOTS conference
- Released algorithms and toolkit for network anomaly notification to perfSONAR users/developers (<http://ontimedetect.oar.net>)
 - GUI tool and Command-line tools with web-interfaces developed
 - Tools have been developed to leverage perfSONAR web-service interfaces for BWCTL, OWAMP and SNMP measurements
 - Demonstrated need for “ground truth” correlation (e.g., NetAlmanac, logs) with detected network anomaly events in perfSONAR community
 - Receiving user feedback for additional features, analysis collaboration and integration into ESnet operations

Progress and Accomplishments Summary

- Developed semantic scheduling algorithms that will allow end-users (not just operators) at DOE Labs and collaborator sites to control measurement sampling in perfSONAR deployments
 - To resolve measurement resource contention when measurement requests exceed the amount of measurement resources:
 - (i) developed ontologies and an inference engine to prioritize measurement requests, and
 - (ii) weather forecasting based solver to lower priority of measurement requests that are oversampling
 - Developed a combined deterministic and heuristic scheduling algorithm to address sampling requirements for meeting monitoring objectives
 - Paper with initial results published in the 2010 IEEE CNSM conference
- Presented research findings and demos in major national and international conferences and workshops in 2010
 - Winter ESCC/Joint Techs, Summer ESCC/Joint Techs, perfSONAR workshop, IEEE MASCOTS, IEEE CNSM, Internet2 Spring Member meeting, (SC10)

Technical Challenges

Grey Area!

(in Multi-domain Measurement Federations)

- Intra-domain and Inter-domain measurement probes access
- Measurement conflicts avoidance
- Measurement request/response protocols
- Measurement sampling frequency guarantees
- Measurement orchestration flexibility (e.g., centralized and distributed)
- Data fusion of multi-metric/layer/timescale measurements
- Expert-systems for “network-aware” applications

Policy Challenges

Grey Area!

(in Multi-domain Measurement Federations)

- Measurement Level Agreements
 - Share topologies, allowed duration of a measurement, permissible bandwidth consumption for measurements, ...
- Semantic Priorities
 - Some measurement requests have higher priority than others
- Authentication, Authorization, Accounting
 - Determine access control and privileges for users or other federation members submitting measurement requests
- Measurement Platform
 - Operating system, Hardware sampling resolution, TCP flavor for bandwidth measurement tests, fixed or auto buffers, ...

Topics of Discussion

- Project Overview
- Workplan Status
- Accomplishments
 - Part I: perfSONAR Deployments' Measurements Analysis
 - Major Activities, Results and Findings
 - Part II: Multi-domain Measurement Scheduling Algorithms
 - Major Activities, Results and Findings
 - Part III: Outreach and Collaborations
- Planned Next Steps

PART - I

perfSONAR Deployments Measurement Analysis

- Activity:
 - Evaluated a network performance “plateau-detector” algorithm used in existing large-scale measurement infrastructures (e.g., NLANR AMP, SLAC IEPM-BW)
 - Analyzed anomaly detection performance for both synthetic and ESnet perfSONAR measurements data, identified limitations in existing implementations’ “sensitivity” and “trigger elevation” configurations
 - Developed “OnTimeDetect” v0.1 GUI and command-line tools based on evaluations
- Significance:
 - perfSONAR data web-service users need automated techniques and intuitive tools to analyze anomalies in real-time and offline manner
 - Network anomaly detectors should produce minimum false alarms and detect bottleneck events quickly
- Findings:
 - Nature of network performance plateaus that affect sensitivity and trigger elevation levels for low false alarms
 - Dynamic scheme for “sensitivity” and “trigger elevation” configuration based on the statistical properties of historic and current measurement samples

Topics of Discussion

- **Related Work**
- Plateau Anomaly Detection
- Adaptive Plateau-Detector Scheme
- OnTimeDetect Tool
- Performance Evaluation
- Conclusions

Related Work

- Recent network anomaly detection studies utilize various statistical and machine learning techniques
- User-defined thresholds are employed to detect and notify anomalies (e.g., Cricket SNMP)
 - Network path's inherent behavior is often not considered
- Mean \pm Std Dev (MSD) methods in Guok et. al., calculate thresholds via moving window summary measurements
 - Not robust to outliers

Related Work (2)

- Soule et. al., created traffic matrix of all links in an enterprise and used a Kalman-filter based anomaly detection scheme
- Several related studies use machine learning techniques for unsupervised anomaly detection (Thottan et. al.,)
- Plateau-detector algorithm (McGregor et. al.,) used in the predecessors (NLNR AMP/SLAC pingER) effectively
 - Widely-used due to simplicity in the statistics involved
 - Easy to configure and interpret for network operators
 - Has limitations for perfSONAR users
 - Static configurations of the salient threshold parameters such as sensitivity and trigger elevation
 - Embedded implementations that are not extensible for web-service users who can query perfSONAR-ized measurement data sets

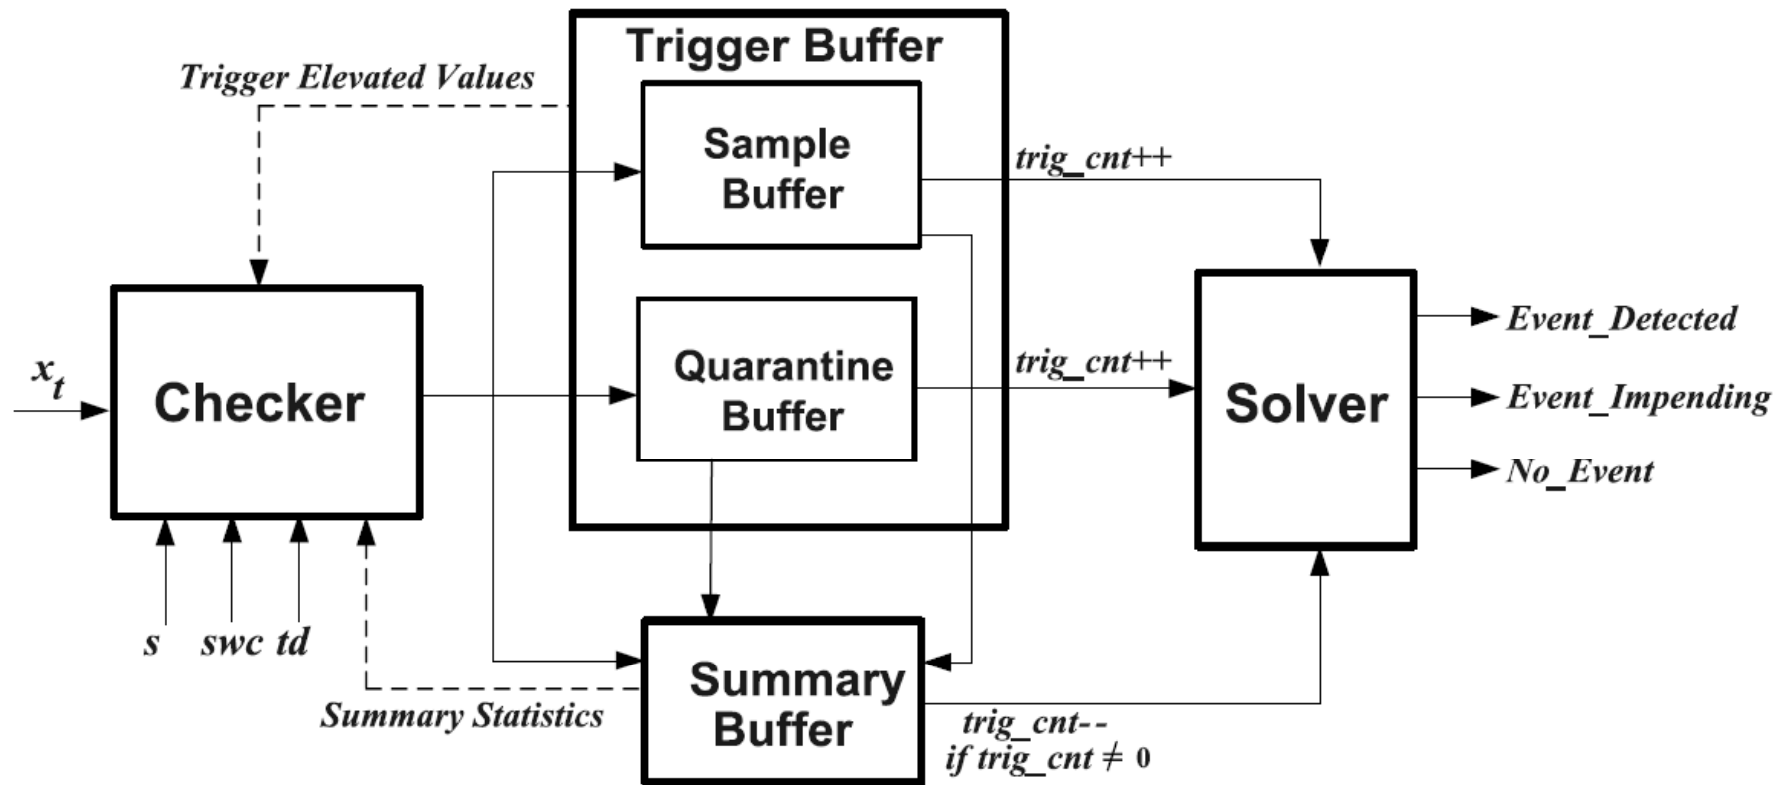

Topics of Discussion

- Related Work
- **Plateau Anomaly Detection**
- Adaptive Plateau-Detector Scheme
- OnTimeDetect Tool
- Performance Evaluation
- Conclusions

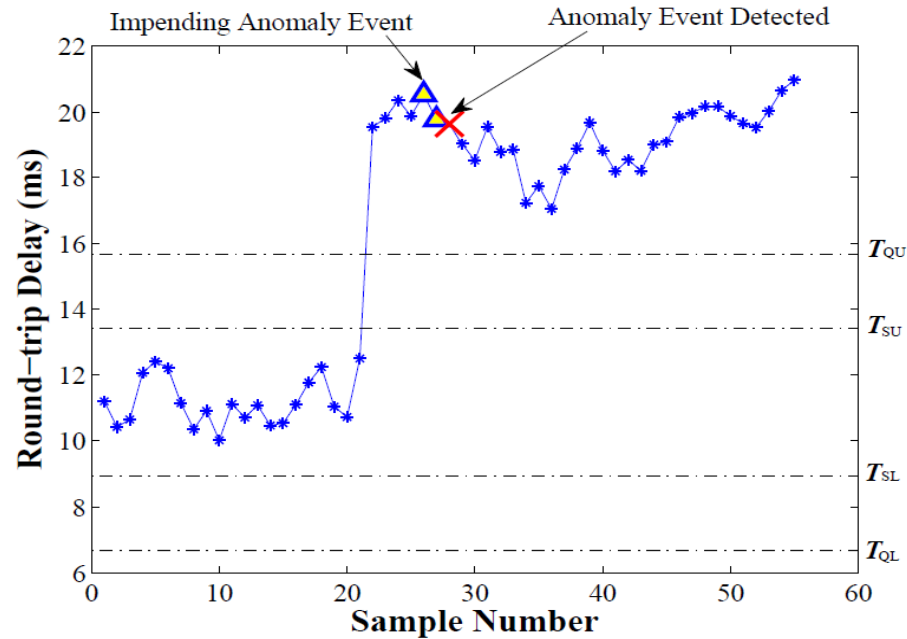

Plateau Anomaly Detection

- Enhanced mean \pm standard deviation (MSD) algorithm
- Plateau detector uses two salient thresholds
 - Sensitivity (s) which specifies magnitude of plateau change that may result in anomaly
 - Trigger duration (t_d) specifies duration of the anomaly event before a trigger is signaled
- Network health norm is determined by calculating mean for a set of measurements sampled recently into “summary buffer”
 - The number of samples in “summary buffer” is user defined and is called summary window count (swc)

Plateau-Detector Block Diagram

Plateau-Detector Thresholds

$ts(.)$

$$\begin{aligned}
 T_{SU} &= \mu + s * \sigma \\
 T_{QU} &= \mu + 2 * s * \sigma \\
 T_{SL} &= \mu - s * \sigma \\
 T_{QL} &= \mu - 2 * s * \sigma
 \end{aligned}$$

Upper and lower threshold limits

$ts'(.)$

$$\begin{aligned}
 T'_{SU} &= 1.2 * \max(x_t) \text{ in } \text{trigbuff} \\
 T'_{QU} &= 1.4 * \max(x_t) \text{ in } \text{trigbuff} \\
 T'_{SL} &= 0.8 * \min(x_t) \text{ in } \text{trigbuff} \\
 T'_{QL} &= 0.6 * \min(x_t) \text{ in } \text{trigbuff}
 \end{aligned}$$

Upper and lower threshold limits in trigger elevated state

Plateau-Detector State Transitions

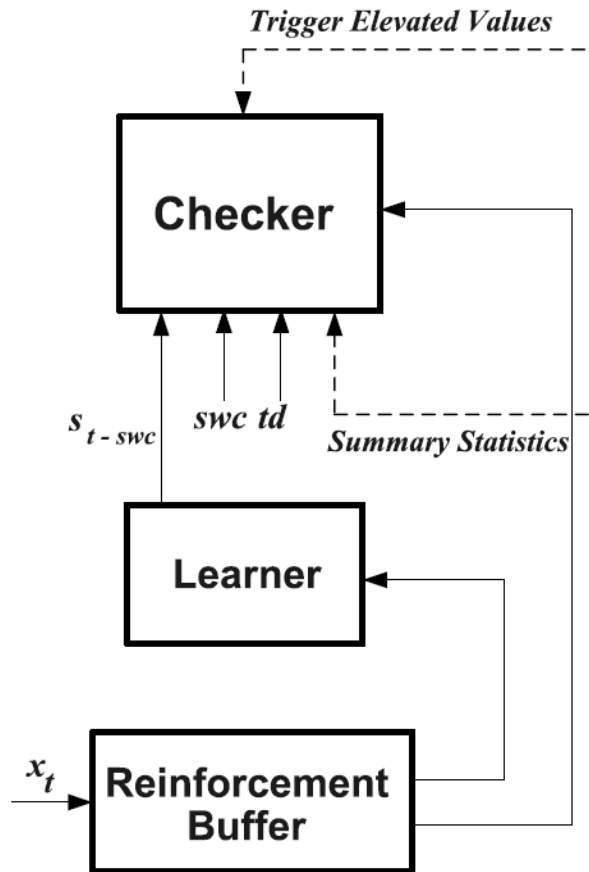

Topics of Discussion

- Related Work
- Plateau Anomaly Detection
- **Adaptive Plateau-Detector Scheme**
- OnTimeDetect Tool
- Performance Evaluation
- Conclusions

Need for Dynamic Plateau-detector Thresholds

- Minor differences in s and $ts'(\cdot)$ parameters selection using “Static Plateau-Detector” (SPD) scheme greatly influence anomaly detection accuracy
 - Evidence from analysis of real and simulated traces
 - Increasing s from 2 to 3 reduces false positives but causes false negative
 - Increasing s to 4 minimizes false positives but false negatives remains
 - Static $ts'(\cdot)$ settings do not detect consecutive anomalies of similar nature occurring within swc in trigger elevated state

Dynamic Threshold Parameters Selection

- Our goal is to avoid manual calibration of sensitivity s and trigger elevation $ts'(\cdot)$ threshold parameters in the SPD scheme
- We apply reinforcement learning that guides the learning process for anomaly detection in our “Adaptive Plateau-Detector” (APD) scheme
 - APD scheme is based on a study of anomaly events in real and synthetic measurement traces, and derived closed-form expressions
 - APD scheme achieves low false alarm rates at the cost of a fractional increase in online detection time for the reinforcement learning

Dynamic Sensitivity Selection

- “Ground truth” challenge – difficult to decide what kind of events are to be notified as “anomaly events”
 - Plateau anomalies – they could affect e.g., data transfer speeds
 - The events we mark as anomalies are based on:
 - Our own experience as network operators
 - Discussions with other network operators supporting HPC communities (e.g., ESnet, Internet2)
- From our study of anomaly events in real and synthetic measurement traffic:
 - We observed that false alarms are due to persistent variations in time series after an anomaly event is detected
 - We concluded that leveraging variance of raw measurements just after an anomaly event for reinforcement learning makes anomaly detection more robust

Dynamic Sensitivity Selection (2)

- Sensitivity s needs to be re-evaluated at each time step
- We use $\frac{\sigma_f^2}{\sigma_c^2}$ relation in our APD scheme to determine sensitivity dynamically at a time step

Sensitivity variations when using APD Scheme for a trace

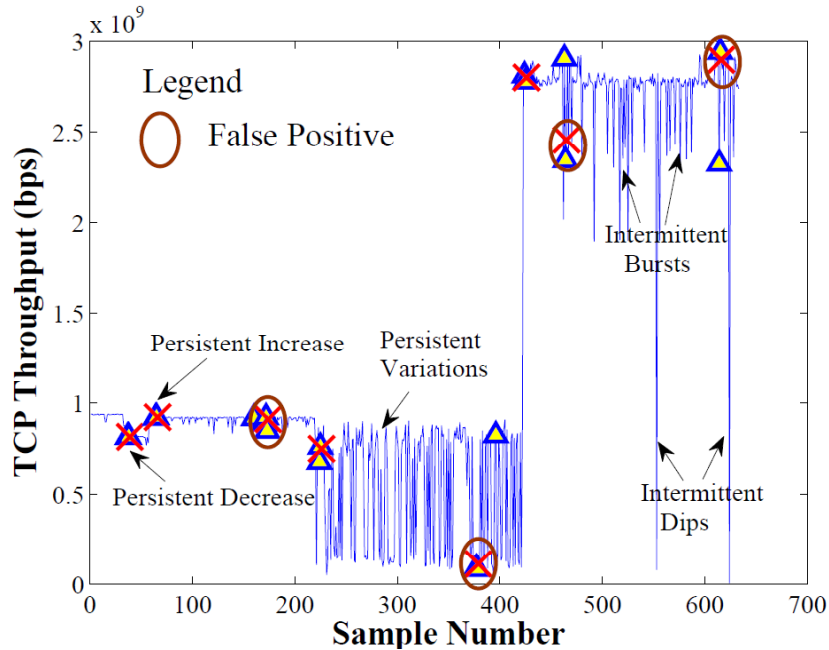

$$\mu_c = \frac{1}{swc} \sum_{i=1}^{swc} swd[i]$$

$$\sigma_c = \sqrt{\frac{1}{swc - 1} \sum_{i=1}^{swc} (swd[i] - \mu_c)^2}$$

$$\mu_f = \frac{1}{swc} \sum_{i=1}^{swc} rbd[i]$$

$$\sigma_f = \sqrt{\frac{1}{swc - 1} \sum_{i=1}^{swc} (rbd[i] - \mu_f)^2}$$

Anomaly Detection Comparison

Static Sensitivity in SPD Scheme

Dynamic Sensitivity in APD Scheme

Dynamic Trigger Elevation Selection

- Using static $ts'(\cdot)$ settings based on $\max(x_t)$ and $\min(x_t)$ in SPD scheme resulted in false alarms
- x_d is the measurement sample arriving at the time instant when an anomaly event is detected (cross mark **X** annotation in graphs)
- Using x_d as network norm in trigger elevated state for calculating thresholds avoids false alarms

$$T'_{SU} = x_d + s_t * \sigma_c$$

$$T'_{QU} = x_d + 2 * s_t * \sigma_c$$

$$T'_{SL} = x_d - s_t * \sigma_c$$

$$T'_{QL} = x_d - 2 * s_t * \sigma_c$$

Dynamic Trigger Elevation Comparison

**Static Trigger Elevation
in SPD Scheme**

**Dynamic Trigger Elevation
in APD Scheme**

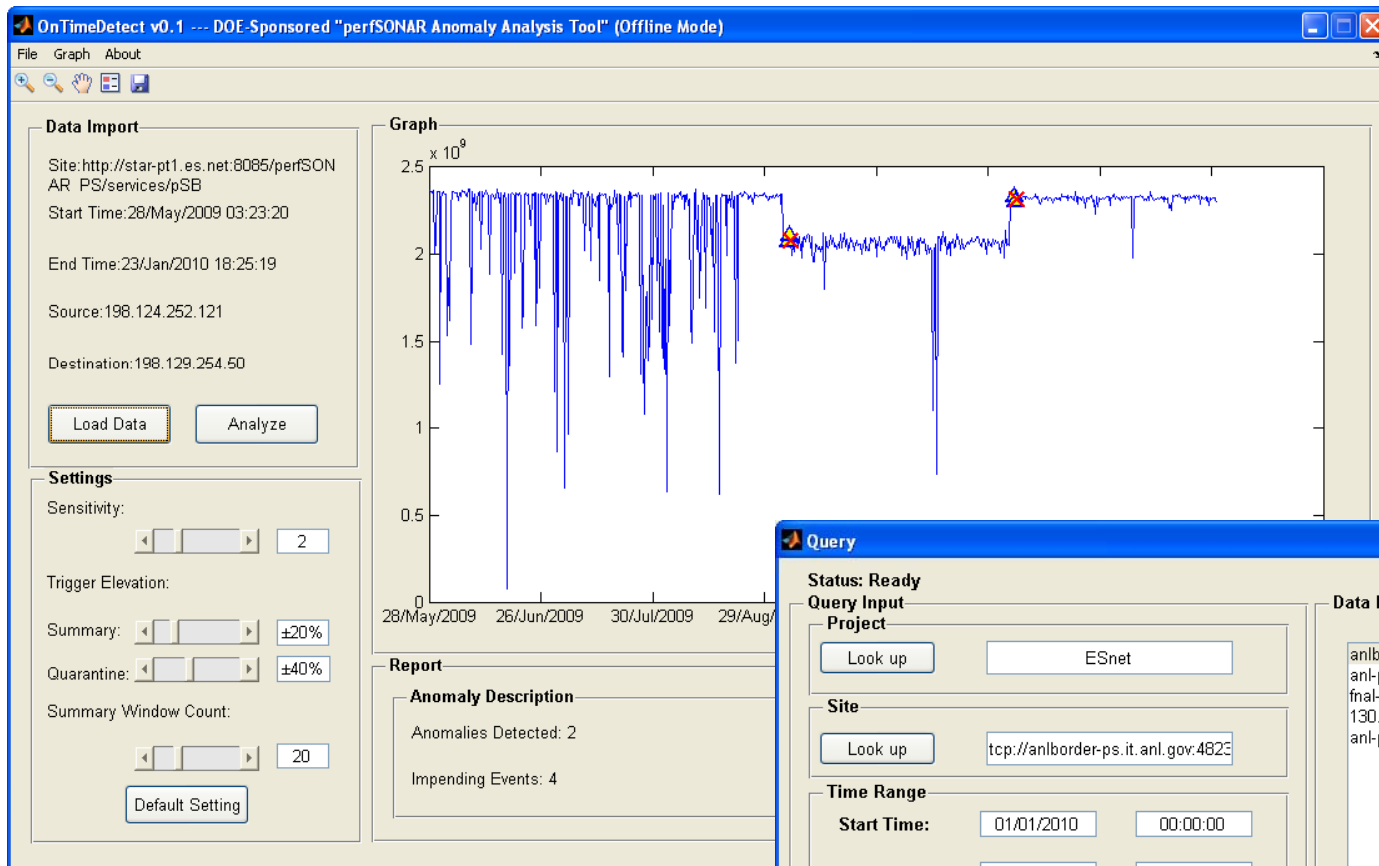

Topics of Discussion

- **OnTimeDetect Tool**
- Performance Evaluation
- Conclusions

OnTimeDetect Tool Features

- GUI Tool (Windows/Linux) and Command-line Tool (Linux)
- Offline Mode
 - Query perfSONAR web-services based on projects, site lists, end-point pairs, and time ranges
 - BWCTL, OWAMP and SNMP data query and analysis capable
 - Drill-down analysis (Zoom-in/Zoom-out, Hand browse) of anomaly events in path traces at multi-resolution timescales
 - Modify plateau-detector settings to analyze anomalies
 - Save analysis sessions with anomaly annotated graphs
- Online Mode
 - Real-time anomaly monitoring for multiple sites
 - Web-interface for tracking anomaly events
 - Interactive web-interface, Twitter feeds, Monitoring Dashboard
- Software downloads, demos, manuals are at -
<http://ontimedetect.oar.net>
<http://www.perfsonar.net/download.html>

OnTimeDetect GUI Tool

The "Query" dialog box is shown in the foreground. It contains the following fields and controls:

- Status:** Ready
- Query Input Project:** Look up ESnet
- Site:** Look up tcp://anlborder-ps.it.anl.gov:4823
- Time Range:** Start Time: 01/01/2010 00:00:00; End Time: 06/01/2010 00:00:00
- Path:** Source: anl-pt1.es.net; Destination: anlborder-ps.it.anl.gov
- Data Files:** A list of files including anlborder-ps.it.anl.gov_fnal-pt1.es.net, anl-pt1.es.net_anlborder-ps.it.anl.gov.t, fnal-pt1.es.net_anlborder-ps.it.anl.gov:130.202.222.58_nettest.lbl.gov.txt, and anl-pt1.es.net_anlborder-ps.it.anl.gov.t. Buttons: Browse, Delete File
- Buttons: Add to Session, OK

OnTimeDetect Command-line Tool

```
root@ontimebeacon-test: ~/user_manual/OnTimeSAT/OnTimeDetect/OnlineScripts
root@ontimebeacon-test:~/user_manual/OnTimeSAT/OnTimeDetect/OnlineScripts# perl ls-offline-detect.pl -h

usage: ls-offline-detect.pl [-tmolqrh] -c <option>
-h                : this (help) message
-c <option>       : 1 = to get list of all project names
                  : 2 = to get sites list based on the command line input(project name)
                  : 3 = to get endpoint pair list based on site name and time range
                  : 4 = to get bwctl data based on site name and time range
-t <site name>   : example tcp://testproject.university.edu:4823
-m <start datetime> : date format ==> MM/DD/YYYY.HH:MM:SS
-o <end datetime>  : date format ==> MM/DD/YYYY.HH:MM:SS
-l <project name> : example project:testproject
-q <Src address>  : example 10.1.1.1
-r <Dst address>  : example 10.1.1.2
-s               : detector sensitivity (2 or 3 or 4)
                  default : 2

Example          : To get list of all project names
                  perl ls-offline-detect.pl -c 1
                  This will create file called RESULT_GLOBAL_QUERY.txt
                  : To get siteslist based on project name
                  perl ls-offline-detect.pl -c 2 -l project:testproject
                  : To get the list of all endpoint pair (SRC,DST) based on sitelist name
                  perl ls-offline-detect.pl -c 3 -t tcp://testproject.university.edu:4823
                  This will create file called RESULT_BWCTL_ENDPOINTLIST.txt
                  *with source_destination fields*
                  : To get bwctl data of endpoint pair based on sitelist name, time range and src and dst addresses
                  perl ls-offline-detect.pl -c 4 -t tcp://testproject.university.edu:4823 -m 3/15/2009.3:30:15 -o 3/15/2010.15:30
:50 -q 10.1.1.1 -r 10.1.1.2 -s 3
                  This will create file called RESULT_TIMELIST.txt
root@ontimebeacon-test:~/user_manual/OnTimeSAT/OnTimeDetect/OnlineScripts#
```

Interactive OnTimeDetect Web-interface

The screenshot displays the OnTimeDetect web interface. At the top center is the logo "OnTimeDetect" with a colorful ECG line graphic. Below the logo is a navigation bar with links: Home, Demo, Tool Download, and Contact. To the right of the navigation bar is an "INFORMATION" section containing a message: "Demo work in progress to show a web-interface to the OnTimeDetect command-line tool. Please consider downloading the tool for your testing".

The main content area is titled "Project List" and includes the instruction "Please select a project to get the corresponding sitelist". Below this is a dropdown menu labeled "Project List :" with "project_perSONAR-PS" selected. A "Submit Query" button is located to the right of the dropdown. The dropdown menu lists the following projects:

- project_perSONAR-PS
- project_ESnet
- project_Internet2
- project_Atlas
- project_USATLAS
- project_LHC
- project_ThaiREN
- project_Viawest
- project_AARNet
- project_UTSystem
- project_UT_Austin TACC
- project_ConnecticutFurcationNetwork
- project_Connecticut Education Network
- project_RedCLARA
- project_GT-Mediciones-CLARA
- project_RNP
- project_UCR
- project_Internet2_CTP
- project_CMS
- project_GLIF
- project_StarLight
- project_Automated GOLE
- project_GLIF Automated GOLE Project
- project_Northern-Lights
- project_RENATER
- project_LHCOPN
- project_IN2P3
- project_CNRS
- project_KOREN
- project_KDL

To the right of the project list is a terminal window titled "Fetching Project List". It contains the following text:

```
To get the list of all project names using command line, use the command  
perl ls-offline-detect.pl 1  
  
Running the previous command will print progress message in the stdout which looks like  
  
Executing Query.....  
Query Time = 1.58870697021484  
Query Success! Got Project information from Lookup service  
  
It creates a result file "RESULT_GLOBAL_QUERY.txt" which has the list of all the project names as listed in
```

The browser's status bar at the bottom shows "Done", "Internet | Protected Mode: On", and a zoom level of "110%".

Interactive OnTimeDetect Web-interface (2)

The screenshot displays the OnTimeDetect web interface. At the top center is the logo "OnTimeDetect" with a colorful ECG line graphic. Below the logo is a navigation bar with links for "Home", "Demo", "Tool Download", and "Contact". The main content area is split into two columns. The left column, titled "Site List", contains a form for "SiteList for project: RedCLARA :". The form has a text input field with the URL "http://192.111.110.34:8085/perfSONAR_PS/services/pSB" and a "Submit Query" button. The right column, titled "INFORMATION", contains a text box with a message: "Demo work in progress to show a web-interface to the OnTimeDetect command-line tool. Please consider downloading the tool for your testing". Below this is a section titled "Fetching Site List" which contains a terminal-style output. The output text is as follows:

```
To get the list of all the
sitelist based on the project
name, use the command

perl ls-offline-detect.pl -c
2 -l project:<ProjectName>

Running the previous command
will print progress message
in the stdout which looks
like

Executing Query .....
Query Time = 152.517479896545
Query Success! Got Sitelist
information from Lookup
service

It creates a result file
<ProjectName>.txt which has
the list of all the project
```

At the bottom of the browser window, the status bar shows "Internet | Protected Mode: On" and a zoom level of "110%".

Interactive OnTimeDetect Web-interface (3)

The screenshot displays the OnTimeDetect web interface. At the top center is the logo "OnTimeDetect" with a colorful ECG-like graphic. Below the logo is a navigation bar with links: Home, Demo, Tool Download, and Contact. The main content area is divided into two sections. On the left, the "End Point List" section prompts the user to "Please select an end-point pair from End Point List dropdown". It includes a "Project Name:" field with the value "http://192.111.110.34:8085/perfSONAR_PS/services/pSB". Below this is a dropdown menu with three options: "192.111.110.34_129.59.197.62", "192.111.110.34_129.59.197.62", and "129.59.197.62_192.111.110.34". A "Submit Query" button is located to the right of the dropdown. On the right side, the "INFORMATION" sidebar contains a message: "Demo work in progress to show a web-interface to the OnTimeDetect command-line tool. Please consider downloading the tool for your testing". Below this is a section titled "Fetching EndPoint (SRC_DST)" which provides instructions on how to use the command-line tool. It includes the command: `perl ls-offline-detect.pl -c 3 -t <sitename> -m <starttime> -o <endtime>`. It also states: "Running the previous command will print progress message in the stdout which looks like Executing Query Query Time = 1.88870565645 Query Success! Got EndPoint information from Lookup service". The browser's status bar at the bottom shows "Internet | Protected Mode: On" and a zoom level of "110%".

Interactive OnTimeDetect Web-interface (4)

The screenshot displays the OnTimeDetect web interface. At the top center is the logo "OnTimeDetect" with a colorful ECG-like graphic below it. A navigation bar contains links for "Home", "Demo", "Tool Download", and "Contact". The main content area is split into two columns. The left column contains a form titled "Please specify the start time and end time to get the Offline measurement data". The form fields are: Project Name (empty), Site Name (empty), Source (192.111.110.34), Destination (129.59.197.62), Start Date and Time (01/01/2009 00:00:00), and End Date and Time (07/01/2010 00:00:00). A "Submit Query" button is located below the form. The right column is an "INFORMATION" sidebar. It contains a message about demo work in progress, a section titled "Fetching EndPoint (SRC_DST)", and instructions on how to use the command-line tool to get offline measurement data. The instructions include a Perl command: `perl ls-offline-detect.pl -c 3 -t <sitename> -m <starttime> -o <endtime> -q <src address> -r <dst address>`. The sidebar also explains that running this command will print BWCTL data in a TIMESERIES file and that a query status message is printed if no data is collected.

OnTimeDetect

Home Demo Tool Download Contact

INFORMATION

Please specify the start time and end time to get the Offline measurement data

Project Name :
Site Name :
Source :192.111.110.34
Destination :129.59.197.62
Start Date and Time : 01/01/2009 00:00:00
End Date and Time : 07/01/2010 00:00:00

Submit Query

Demo work in progress to show a web-interface to the OnTimeDetect command-line tool. Please consider downloading the tool for your testing

Fetching EndPoint (SRC_DST)

To get offline measurement data based on sitelist name, time range and src and dst address, use the command

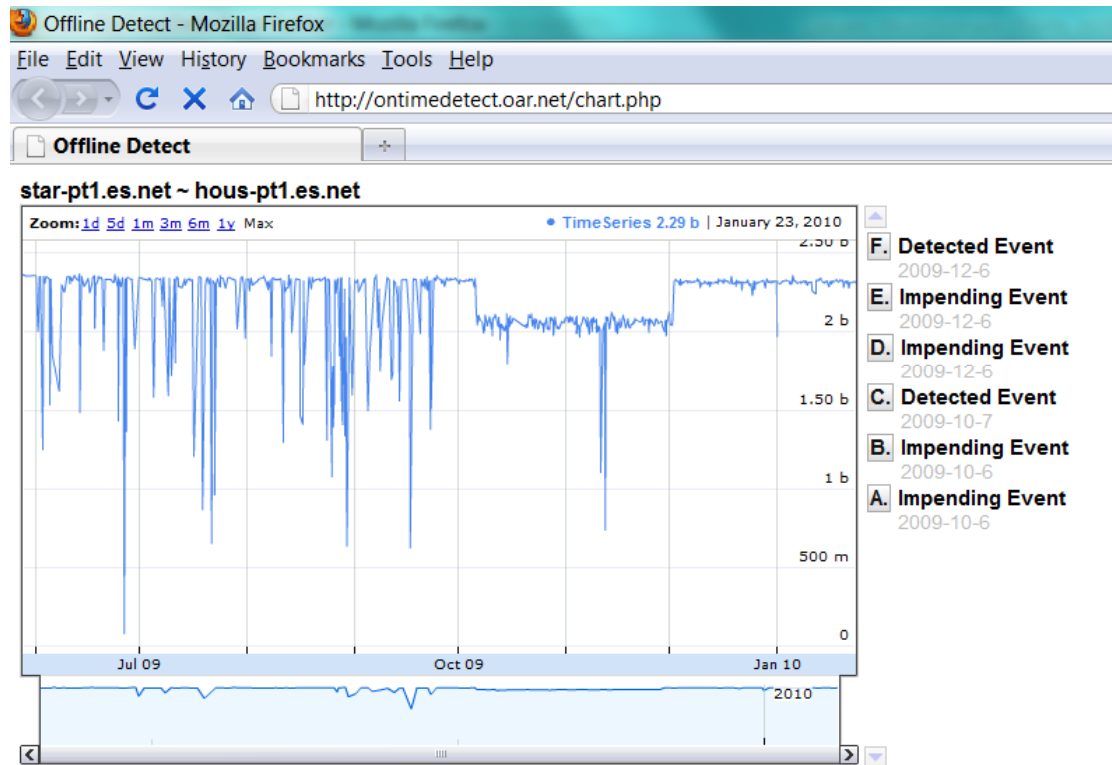

```
perl ls-offline-detect.pl -c 3 -t <sitename> -m <starttime> -o <endtime> -q <src address> -r <dst address>
```

Running the previous command will print BWCTL data collected in a TIMESERIES file as shown in this page

If there is no data collected between the endpoints based on the sitelist and time range specified, then the query status message printed

Done Internet | Protected Mode: On 110%

- Adaptive Plateau-Detector Scheme
- OnTimeDetect Tool
- **Performance Evaluation**
- Conclusions

Tool Deployment Experiences

- OnTimeDetect tool has been used to analyze BWCTL measurements from perfSONAR-enabled measurement archives at 65 sites
- Anomalies analyzed on 480 network paths connecting various HPC communities (i.e., universities, labs, HPC centers) over high-speed network backbones that include ESnet, Internet2, GEANT, CENIC, KREONET, LHCOPN, ...
- Evaluation performed in terms of *accuracy*, *scalability* and *agility* of anomaly detection

Accuracy Evaluation Metrics

$$\text{Success Ratio } R_s = \frac{\text{number of true triggers detected}}{\text{number of true triggers}}$$

$$\text{False Positive Ratio } R_{f+} = \frac{\text{number of false triggers detected}}{\text{number of true triggers}}$$

$$\text{False Negative Ratio } R_{f-} = \frac{\text{number of true triggers missed}}{\text{number of true triggers}}$$

Employed Traces Description

Adaptive Sampling

Conclusions

- Effort to extend the NLANR/SLAC implementations of a network performance “plateau-detector” for perfSONAR deployments
- Evaluated anomaly detection performance for both actual perfSONAR and synthetic measurement traces
- Developed a dynamic scheme for “sensitivity” and “trigger elevation” configuration based on the statistical properties of historic and current measurement samples
 - Produces low false alarm rate and can detect anomaly events rapidly when coupled with adaptive sampling
- Developed “OnTimeDetect” tool from evaluation experiences
 - Tool with APD scheme and intuitive usability features for detecting and notifying network anomalies for the perfSONAR community

Topics of Discussion

- Project Overview
- Workplan Status
- Accomplishments
 - Part I: perfSONAR Deployments' Measurements Analysis
 - Major Activities, Results and Findings
 - Part II: Multi-domain Measurement Scheduling Algorithms
 - Major Activities, Results and Findings
 - Part III: Outreach and Collaborations
- Planned Next Steps

PART - II

Multi-domain Measurement Scheduling Algorithms

- Activity:
 - Evaluated an offline Heuristic Bin Packing algorithm and Earliest Deadline First (EDF) based deterministic scheduling algorithm for scheduling active measurement tasks in large-scale network measurement infrastructures
 - Developed a combined deterministic and heuristic scheduling algorithm to address sampling requirements for meeting monitoring objectives
 - Analyzed scheduling output for various sampling time patterns (e.g., periodic, random, stratified random, adaptive) and comparing with monitoring objectives
- Significance:
 - Measurement schedulers should handle diverse sampling requirements of users to assist in their measurement analysis objectives
 - Efficient scheduling algorithms should allow more users (e.g., network operators, researchers) to sample network paths, handle semantic priorities and can also better support on-demand measurement sampling with rapid measurement response times
- Findings:
 - Effects of scheduling measurement tasks with mixtures of sampling pattern requirements – context of full-mesh, tree and hybrid topologies for increasing number of measurement servers, measurement tools and MLA bounds
 - Potential for tuning sampling frequency and limiting oversampling measurement requests using network weather forecasting

Measurements Provisioning Meta-scheduler

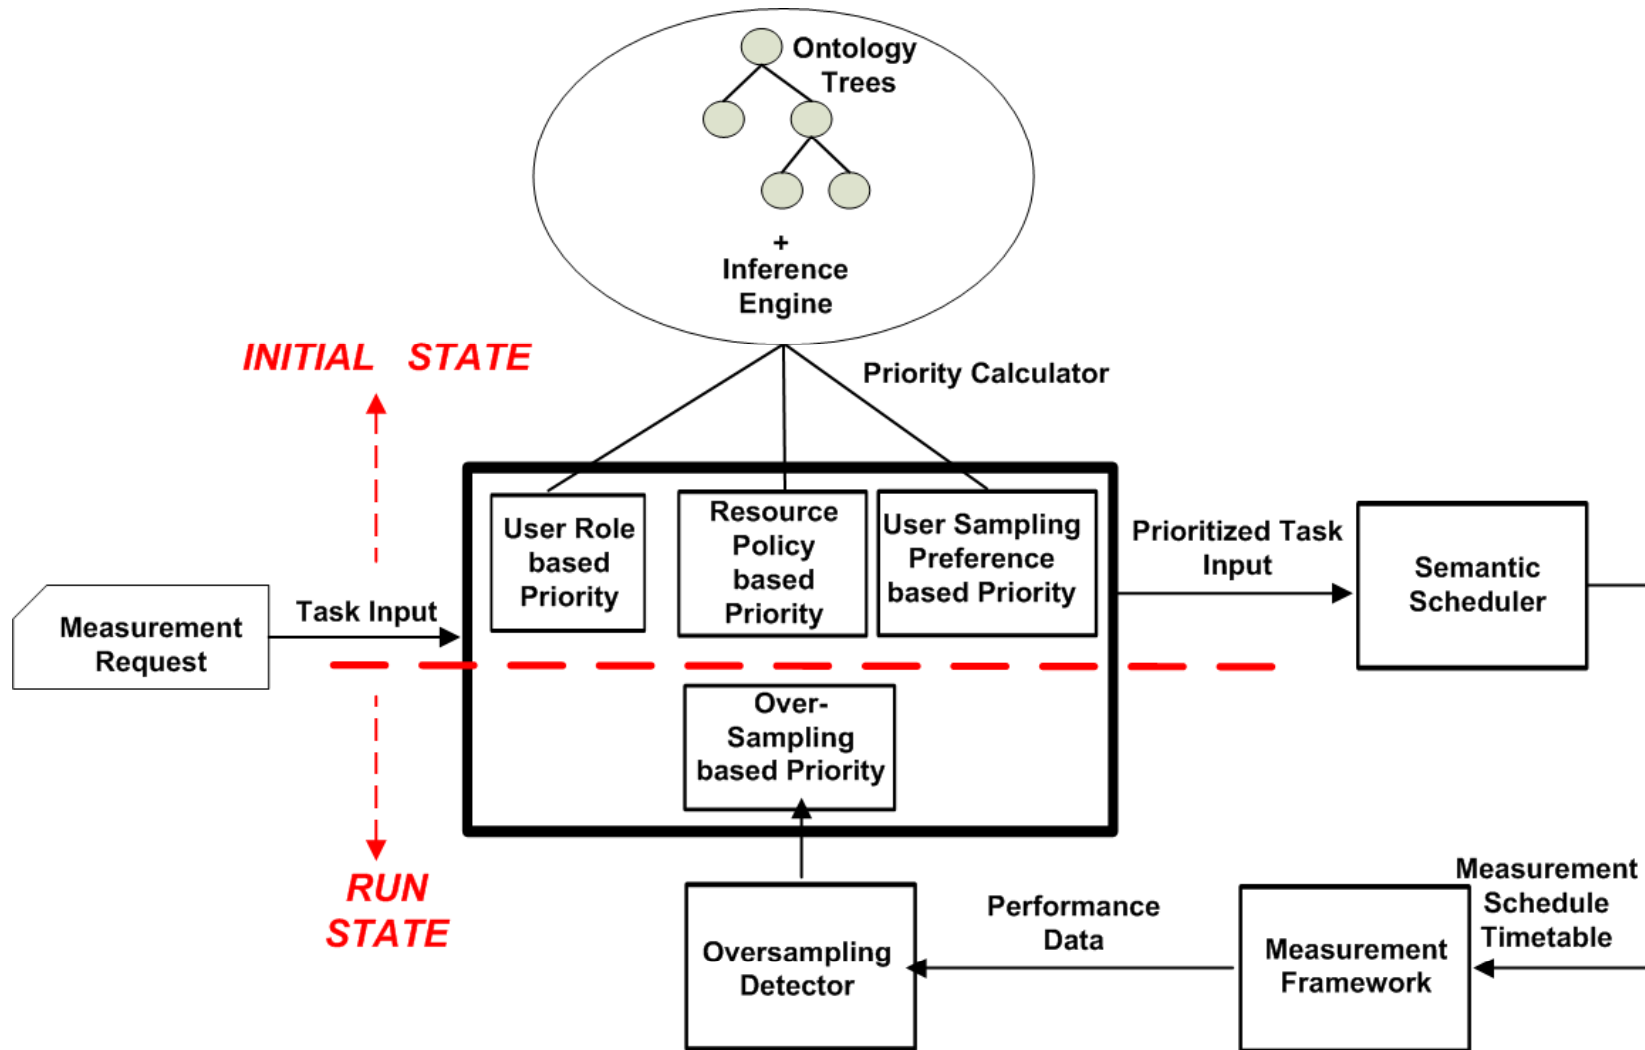

- Meta-scheduler for provisioning perfSONAR measurements
 - Benefit is that measurement collection can be targeted to meet network monitoring objectives of users (e.g., adaptive sampling)
 - Provides scalability to perfSONAR framework
 - If more tools are added, it allows for conflict-free measurements
 - On-demand measurement requests served with low response times
 - Can enforce multi-domain policies and semantic priorities
 - Measurement regulation; e.g., Only (1-5) % of probing traffic permitted
 - Intra-domain measurement requests may have higher priority, and should not be blocked by inter-domain requests
 - Measurement requests from users with higher credentials (e.g., backbone network engineer) may need higher priority than other users (e.g., casual perfSONAR experimenter)

Clear evidence of oversampling in perfSONAR deployments

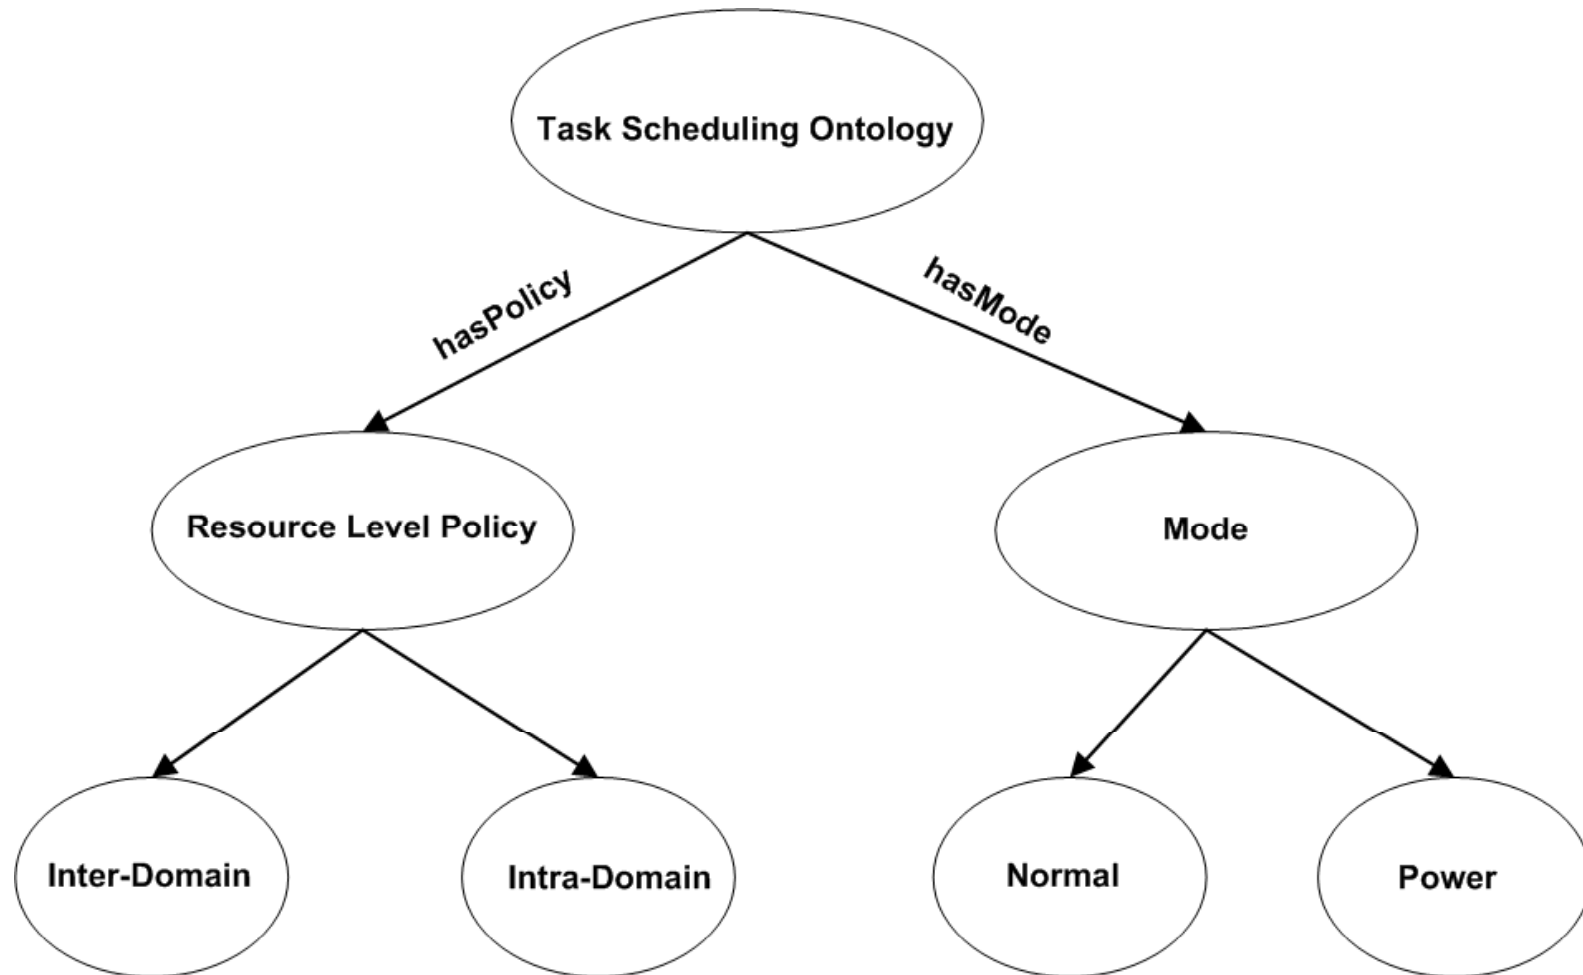

Ontology-based Semantic Meta-scheduler

Personal Ontology

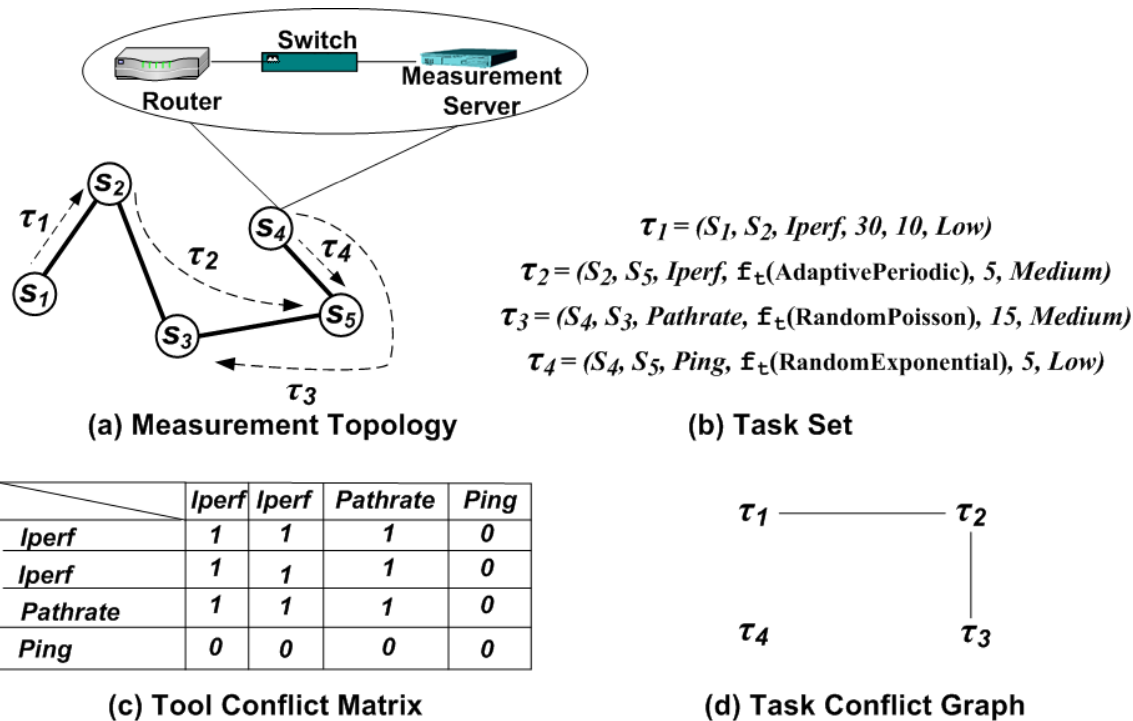

Task Scheduling Ontology

Basic Sampling Problem Overview

- Given:
 - $N = \{S_1, S_2, S_3, S_4, \dots\}$ is the set of measurement servers
 - E is the set of edges between a pair of servers
 - $G = (N, E)$ measurement topology
 - $\zeta = \{\tau_1, \tau_2, \tau_3, \dots, \tau_n\}$ corresponds to a measurement task set
 - ψ refers to a “Measurement Level Agreement” (MLA)
- Problem:
 - **Offline Scheduling** – For a G measurement topology, find the schedule of measurement jobs such that all deadlines (equal to periods) can be met for all tasks in ζ , while *maximizing concurrent execution*, but *preventing conflicts* and adhering to MLA constraint ψ
 - **Online Scheduling** - For an on-demand measurement request J_k , schedule it *as early as possible* without violating deadlines of tasks in ζ , but *preventing conflicts* and adhering to MLA constraint ψ

“Concurrent Execution” (CE) Principle

- Construct a “Task Conflict Graph” based on a “Tool Conflict Matrix” obtained from empirical observations
- Concurrent execution decision during scheduling is based on “Task Conflict Graph” edges
 - Edge implies conflict exists!

Offline Scheduling Algorithms

- Goal: To schedule on-going measurements maximizing concurrent execution
- Algorithms based on real-time systems scheduling principles; two preliminary algorithms we developed are:
 - Heuristic bin packing
 - Simple and effective for routine network monitoring, but is rigid to handle on-demand measurement requests
 - Causes job starvation problems
 - Provides schedule with deadline misses that is sometimes sufficient
 - Earliest Deadline First with CE (EDF-CE)
 - Caters measurement periodicity and flexible for on-demand measurements
 - Infeasible schedules for deadline misses

Heuristic Bin Packing Illustration

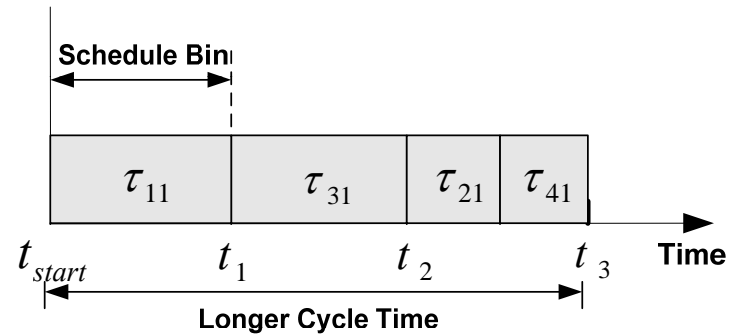

$\tau_1 = (S_1, S_2, Pathchar, 20)$
 $\tau_2 = (S_2, S_3, Iperf, 10)$
 $\tau_3 = (S_3, S_5, H.323Beacon, 20)$
 $\tau_4 = (S_5, S_1, Iperf, 10)$

(a) Task Set

(b) Task Conflict Graph

(c) Round Robin Packing (RRP)

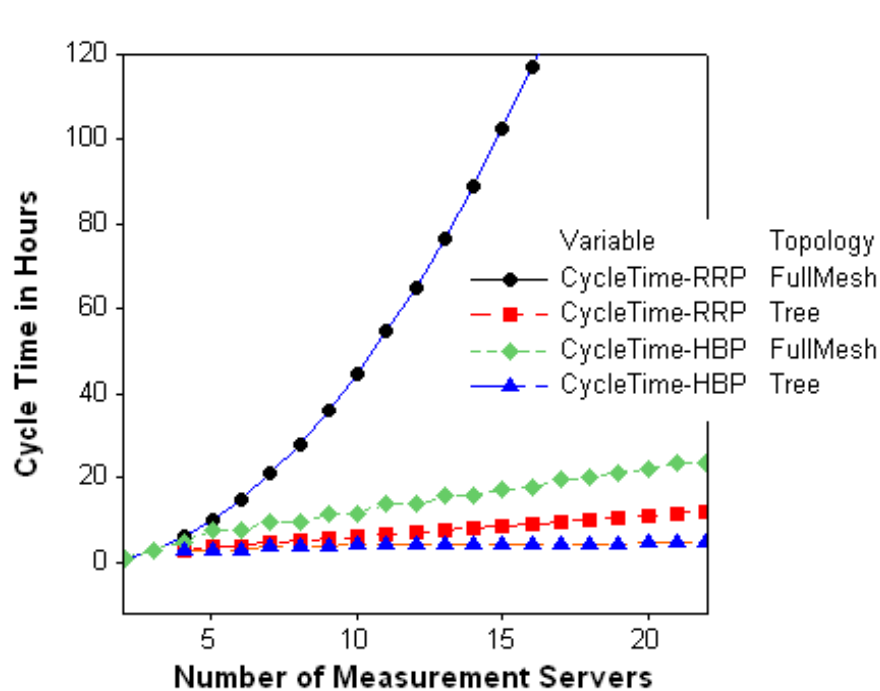

(d) Heuristic Bin Packing (HBP)

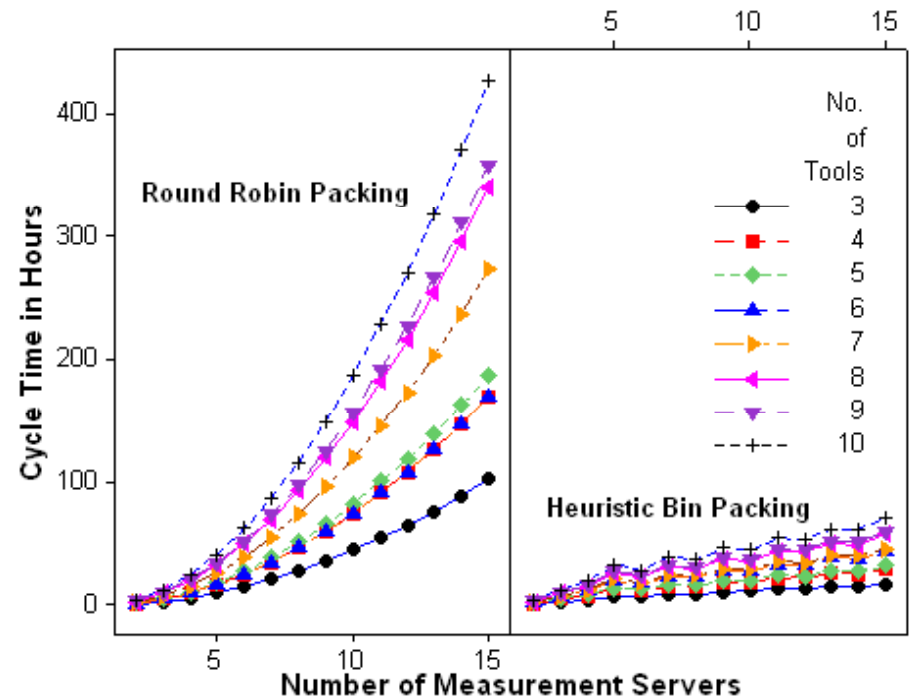

- **Cycle time** – measurement schedule completion time in NMI

Performance of Heuristic Bin Packing

- Synthetic task set simulation with 5 and 20 minute execution time jobs; fixed bin size of 20 minutes
- Measurement topologies: Full-mesh, Tree, Hybrid
- Significantly shorter cycle times for HBP compared to RRP
 - For any measurement topology, For any number of tools
- Developed an optimum bin size selection scheme that can improve cycle times and minimize “job starvation”

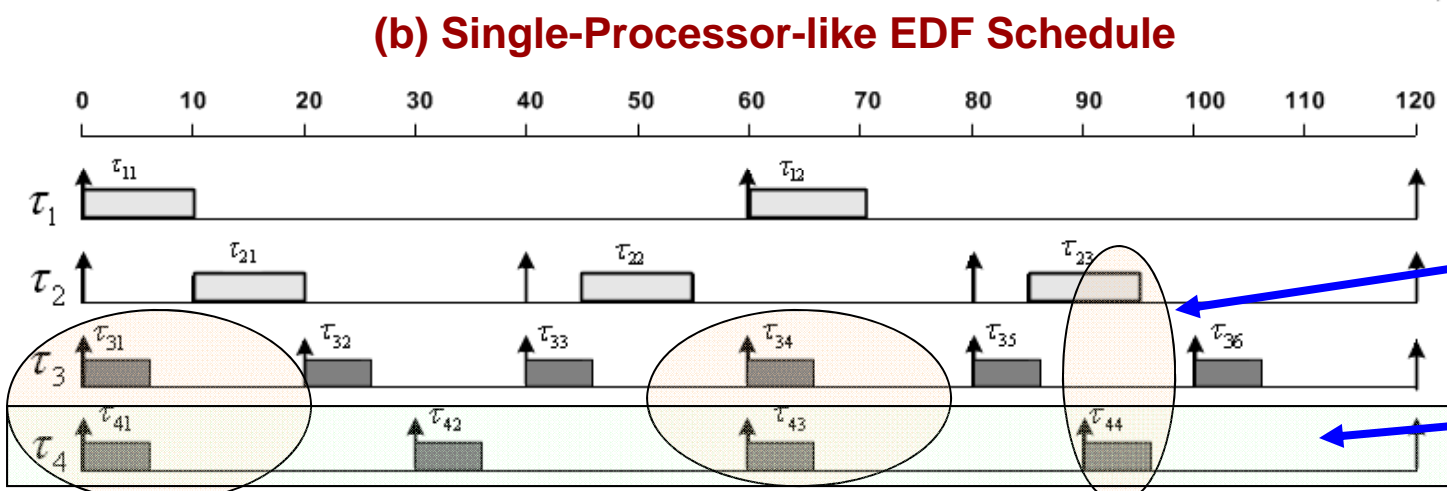

(a) Comparison with Round-robin for different measurement topologies

(b) Comparison with Round-robin for increasing number of tools

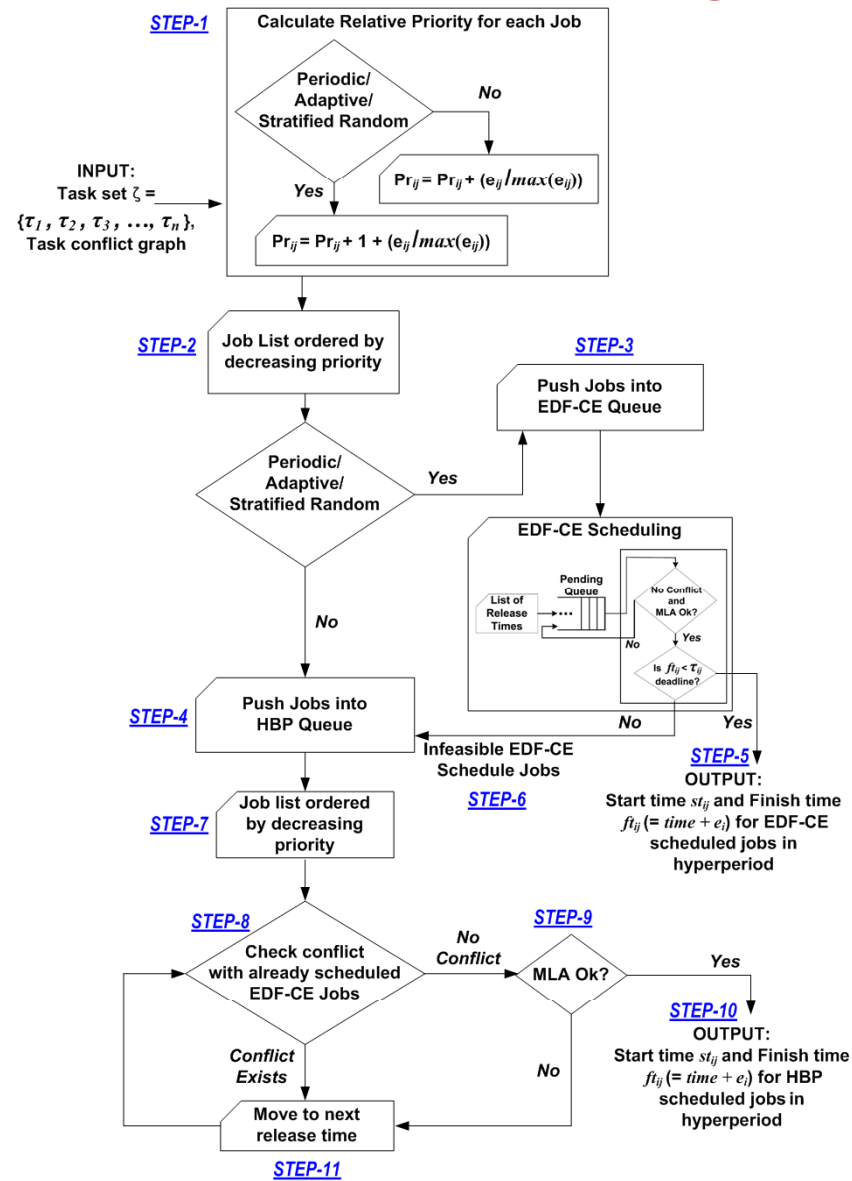

EDF-CE Illustration

Higher
schedulability
due to CE

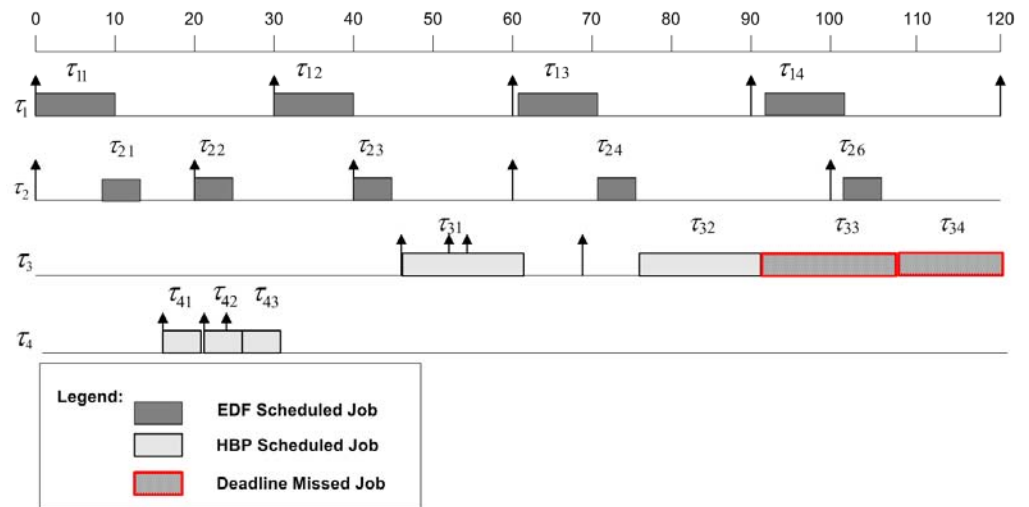

Can schedule an
additional task

Semantic Scheduling Scheme

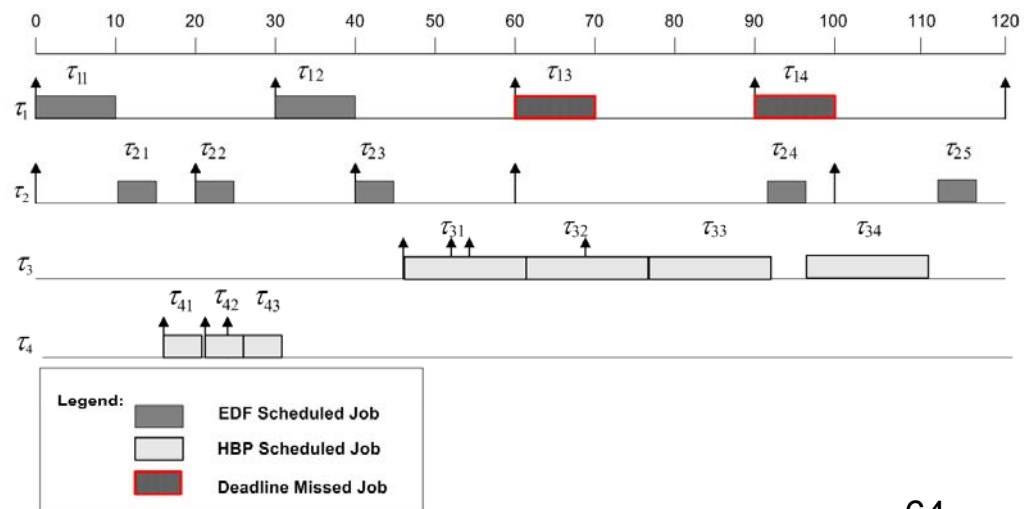

Semantic Grade Influence on Schedules

- SPS-PE algorithm:***
 High execution time periodic tasks get higher priority, and have the best chance to be scheduled before deadline

- SPS-GPE algorithm:***
 Semantic grade overrides priorities based on period and execution time

Cycle Time Performance

- As the MLA constraint value (given by maximum number of concurrent execution jobs permitted network-wide) increases, the cycle time decreases

Satisfaction Ratio Performance

- Satisfaction ratio using the SPS-GPE algorithm is always equal to 1 even with large number of task inputs

Planned Next Steps

- Multi-domain Measurement Scheduling Algorithms
 - Continue evaluation of semantic scheduling algorithms
 - Investigate multi-layer sampling approaches
 - Design and develop perfSONAR web-service extensions for multi-layer and multi-domain measurements
 - Integrate into perfSONAR resource protection service
- perfSONAR deployments' Measurements Analysis
 - Use Throughput, RTT, and SNMP data sets and compare with other anomaly detection methods (e.g., Kalman filter, PCA)
 - Release improved versions of “OnTimeDetect” tool to diverse users (e.g., network operators, researchers)
 - Integrate anomaly detection research into DOE operations and applications for analyzing measurement data sets

Thank you for your attention! 😊

“OnTime*” Toolkit

- “OnTime*”: OnTime Sampling and Analysis Toolkit
 - “OnTimeSample”, “OnTimeDetect”, “OnTimePredict”
- End-user toolkit that allows end-to-end performance sampling and analysis in DOE science community applications (e.g., OSCARS, GridFTP)
 - Allows users to specify monitoring objectives and provisions on-going and on-demand measurement samples on ESnet paths
 - Uses multi-layer measurements from ESnet perfSONAR deployments for analysis such as:
 - Network paths monitoring
 - Network weather forecasting
 - Network performance anomaly detection
 - Network-bottleneck fault-location diagnosis
 - Integrates into social networking forums
 - Forum examples - ESnet’s Net Almanac, Twitter

The “network-awareness” gap!

- **Network Researcher**

- Bandwidth-on-demand
- DDoS Traceback
- Path Switching
-

“Measurements Provider can provide measurements when, where and how ever I want!”

“Hey Measurements Provider, I need pure periodic samples of available bandwidth on xyz paths crossing A, B and C domains for my performance forecasting”

- **Measurements Provider**

- Measurements collection
- Measurement graphs
- Measurement query
-

“I am collecting all the measurements a network researcher would want!”

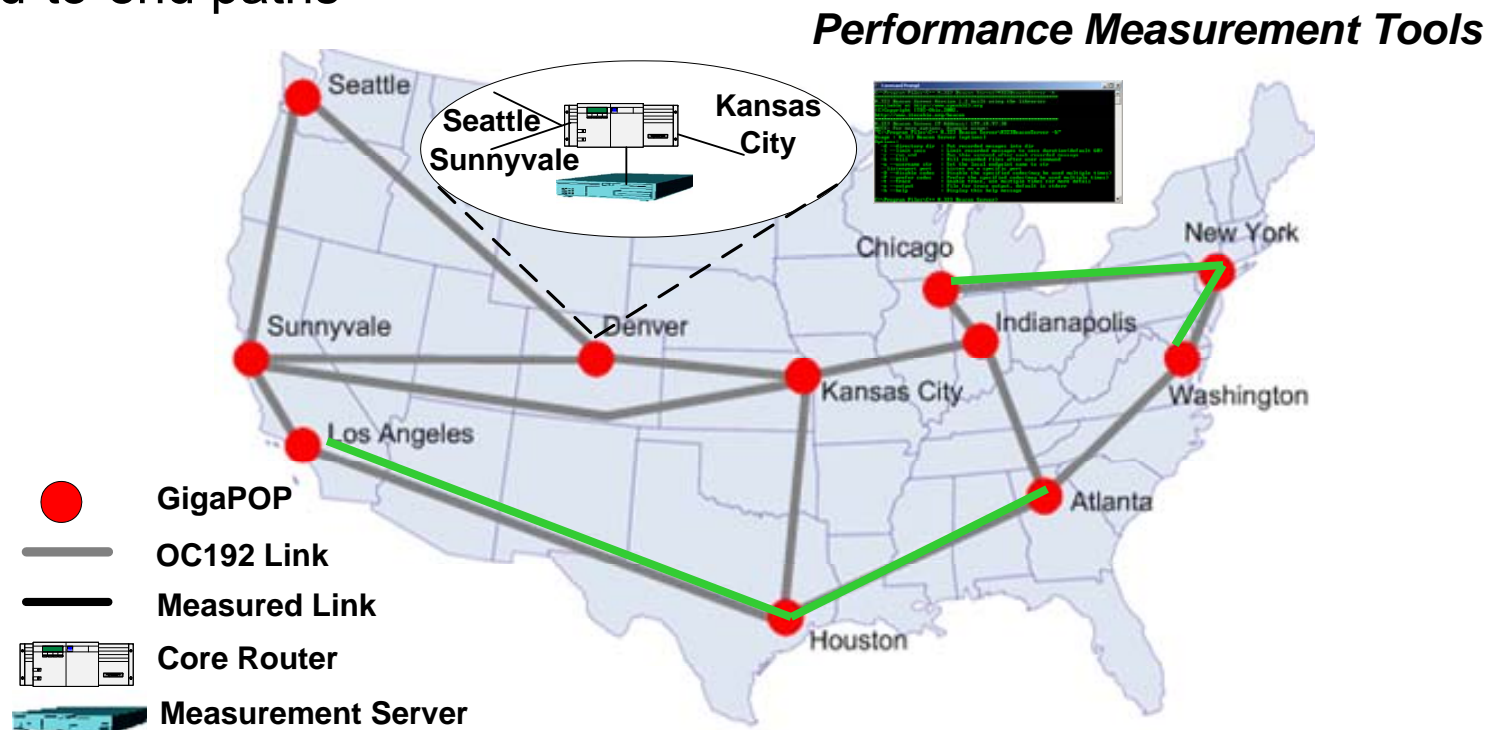

“Oh, I don't collect pure periodic samples, and don't know if A, B and C domains collect available bandwidth measurements!”

- This gap between “assumptions of theory” (researchers) and “delivering ability of reality” (ISPs) can be bridged by:

- Efficient sampling techniques that meet measurement timing demands
- Measurement federation policies to provision multi-domain measurements

Network Measurement Infrastructures

- NMs monitor network paths for network weather forecasting, anomaly-detection and fault-diagnosis
- Measurement servers are deployed at strategic network points in a network domain
- **Tools** on measurement servers measure network QoS along end-to-end paths

Measurement Requests

- On-going measurement task format

$$\tau_i = (\langle src_i \rangle, \langle dst_i \rangle, \langle tool_i \rangle, \langle period p_i \rangle, \langle execution time e_i \rangle)$$

Example: $\tau_1 = (Denver, Seattle, Iperf, 60, 20)$

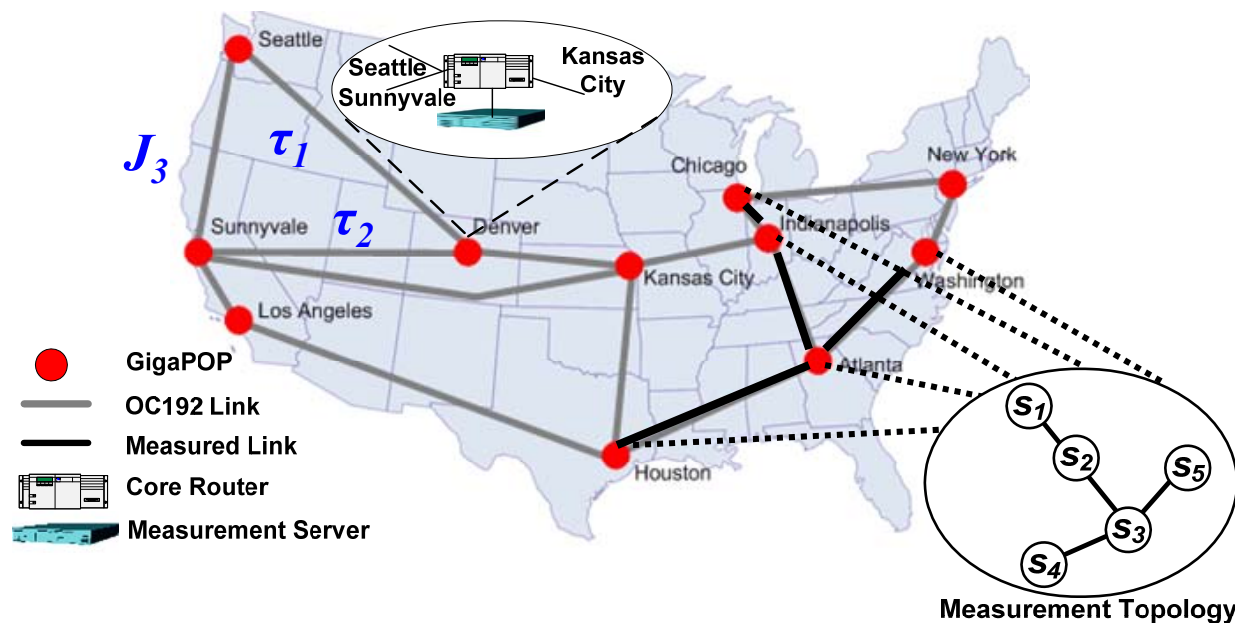

$$\tau_2 = (Denver, Sunnyvale, Iperf, 60, 20)$$

- On-demand measurement job format

$$J_i = (\langle src_i \rangle, \langle dst_i \rangle, \langle tool_i \rangle, \langle execution time e_i \rangle)$$

Example: $J_3 = (Sunnyvale, Seattle, Iperf, 20)$

- Measurement topology

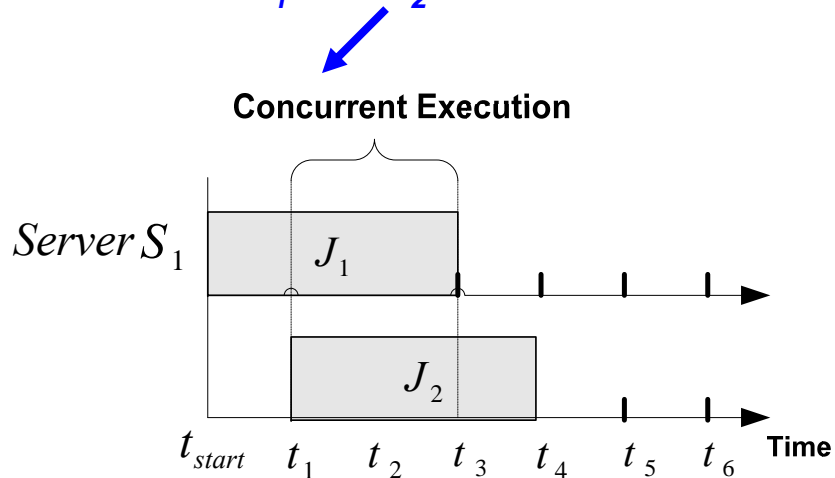

perfSONAR Overview

- A set of high level services for managing multi-domain measurement/monitoring infrastructures
- International community of developers
 - Implementing Open Grid Forum (OGF) Network Measurement (NM-WG) recommendations
- Deployed at ESnet, Internet2, GEANT, DOE Labs, Regional networks, University campuses, ...

Measurement Conflict Problem

- Tools can intensively consume CPU and/or channel resources
 - Measurements of such tools conflict with one another if concurrently executed on same measurement server or path
 - Produce misleading reports of network status
 - Channel resource limitation is the main bottleneck
 - Concurrent execution allows more frequent sampling of network status (i.e., improves schedulability)
 - Measurements tools not on same path or non-conflicting on a server

Allowed if J_1 and J_2 do not conflict

Mutual Exclusion if J_1 and J_2 have conflict

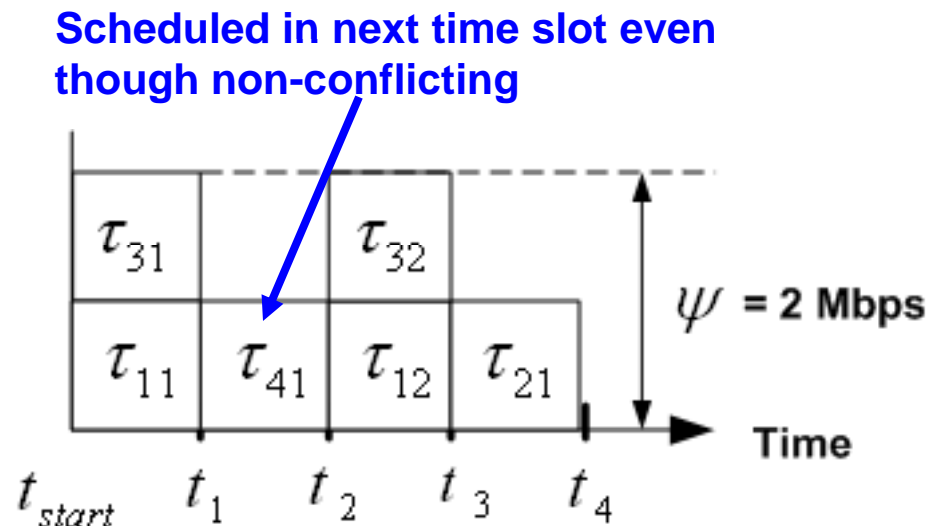

“Measurement Conflict” Illustration

- Iperf bandwidth tests in a LAN testbed with 1500Kbps bandwidth
- Background traffic (i.e., a Videoconference session) using ~768Kbps bandwidth in the LAN testbed

Measurement Regulation

- Measurement traffic consumes bandwidth of actual application traffic
- Regulation using Measurement Level Agreements (MLAs)
 - E.g. Only (1-2) Mbps or (1-5) % of active measurement traffic permitted
- MLA constraint restricts the amount of measurements on a path
 - Example below assumes each job consumes 1 Mbps bandwidth

Related Measurement Conflict Resolution Work

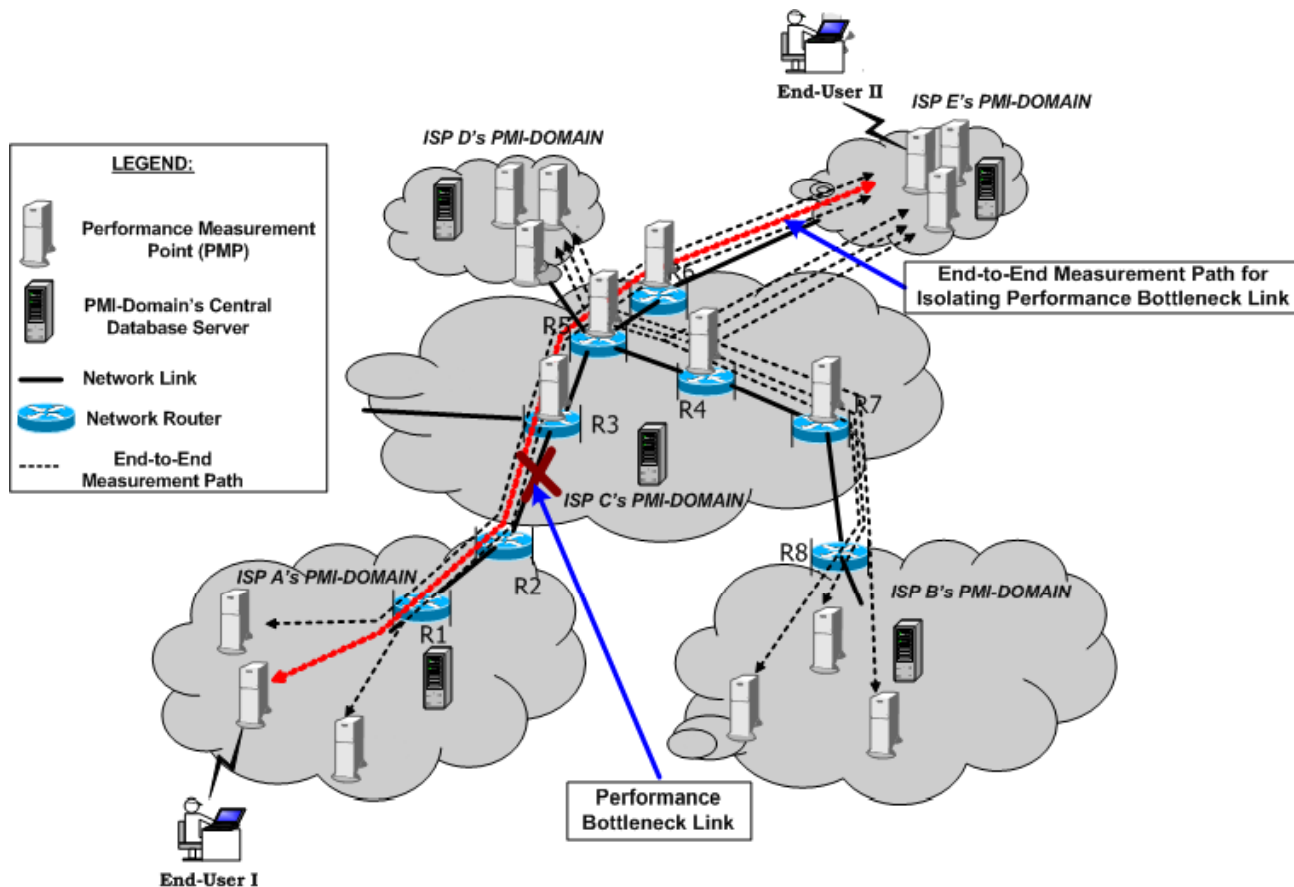

- No Orchestration
 - Used in traditional NMs (e.g., pingER)
 - Measurement conflicts not an issue
 - Single-processor-like Scheduling
 - Simple Round-robin Scheduling
 - Used in NLANR AMP [1]
 - Resource broker Scheduling
 - Used in Internet2 perfSonar [2]
 - Token passing Scheduling
 - Used in Network Weather Service [3]
-
1. None of them leverage Concurrent Execution when possible
2. None of them handle on-demand measurement job requests
