## NDL for the GLIF - NDL Generator

NDL - Network Description Language - is an ontology for description of (hybrid) networks, aimed at facilitating the inter and intra domain lightpath provisioning. The GLIF collaboration makes use of NDL to describe each individual domain, allowing for example the generation of global GLIF network maps.

This page will guide you through the generation of a NDL file that describe your network.

---

### Step 1 - Location

Indicate the identifier and the human readable name of the network that is going to be described in NDL.

Identifier  (Human-readable) Name

Provide also the latitude and the longitude of this location. Both latitude and longitude should use **floating point** notation.

Latitude  Longitude

---

### Step 2 - Devices

Indicate the name of the devices present in the network. If you need to describe more devices just press "Add a Device"
