

Xe doping analysis update

29/05/2020

L. Bomben, C. Cattadori

Improvements on <wfm> analysis

- a single <wfm> (calibrated in # of photons) is now computed for each XArapuca module, by summing the 3 channels → increase statistics for following operations
- error for each bin is estimated as $\sqrt{\text{\# of photons}}$

Subtracting the Xe light from the No Quartz <wfm>

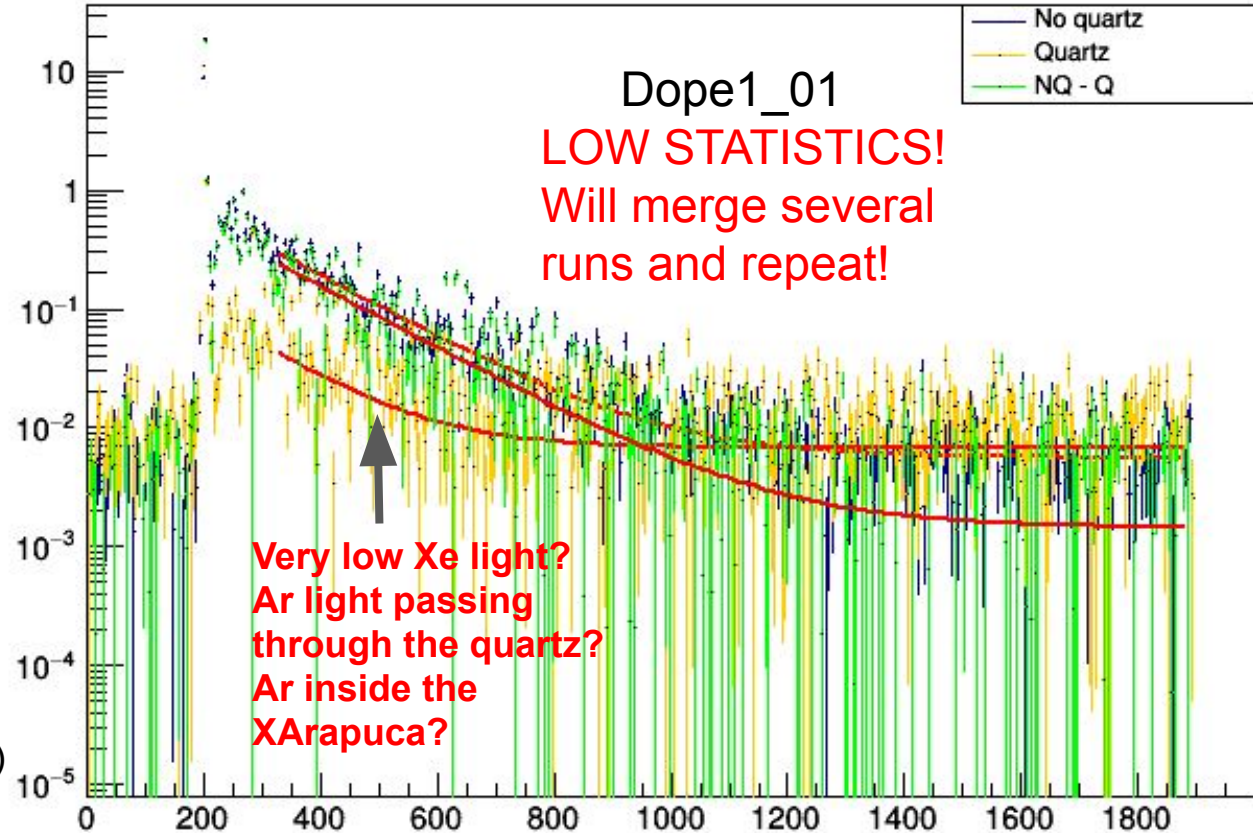

- the quartz XArapuca <wfm> is subtracted from the no-quartz → get the residual Ar light fraction
- the NQ-Q <wfm> SNR suffers → re-binning by a factor 4

NQ - Q $\langle wfm \rangle$: start of doping 1

	$\langle wfm \rangle$ integral	τ_{slow} [ns]
NQ	60.4(0.3)	1079(17)
Q	22.0(0.3)	869(134)
NQ-Q	38.5(0.4)	1113(29)

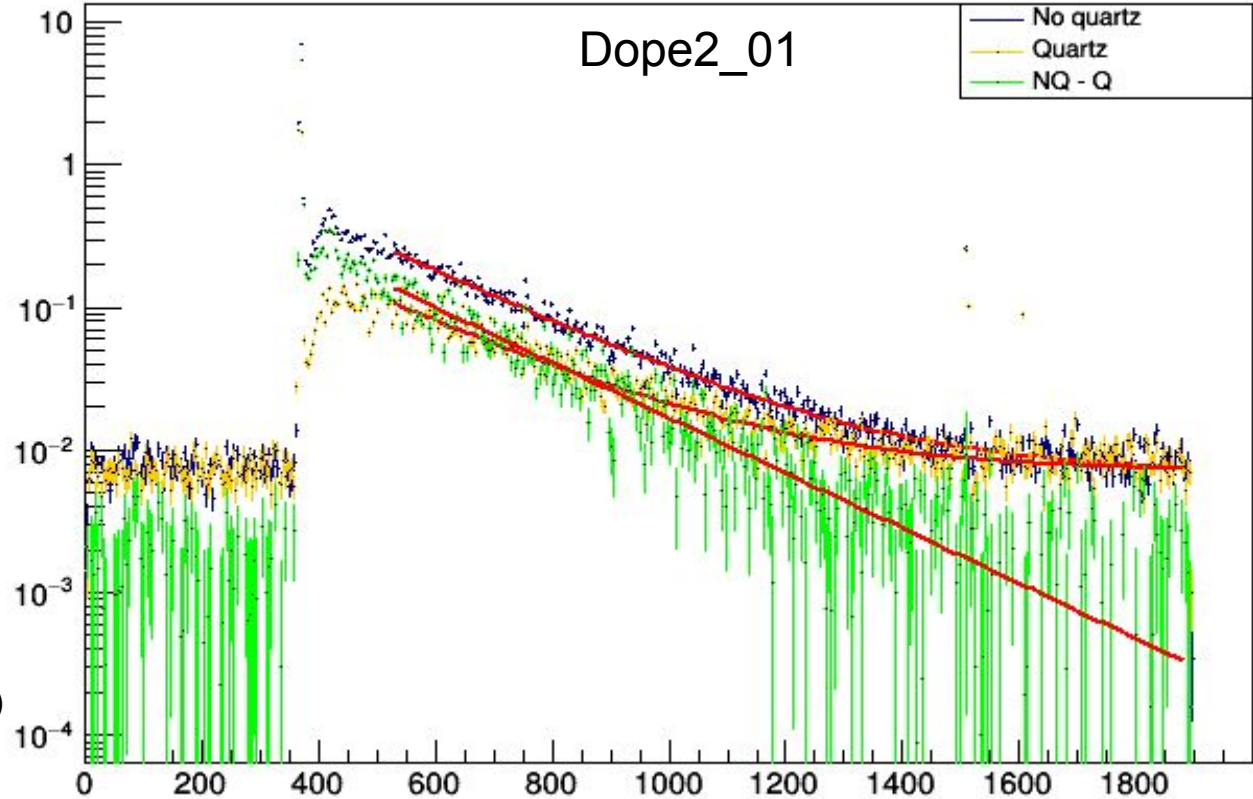

$$\text{Ar/Xe} = \text{Int}_Q / (\text{Int}_{\text{NQ}} - \text{Int}_Q) = 1.75(0.03)$$

NQ - Q <wfm>: start of doping 2

	<wfm> integral	τ_{slow} [ns]
NQ	38.7(0.1)	1553(9)
Q	17.2(0.1)	1619(19)
NQ-Q	21.4(0.1)	1498(15)

$$\text{Ar/Xe} = \text{Int}_{\text{Q}} / (\text{Int}_{\text{NQ}} - \text{Int}_{\text{Q}}) = 1.24(0.01)$$

NQ - Q $\langle wfm \rangle$: start of doping 3

	$\langle wfm \rangle$ integral	τ_{slow} [ns]
NQ	44.3(0.1)	1267(6)
Q	25.5(0.1)	1281(8)
NQ-Q	18.9(0.1)	1256(22)

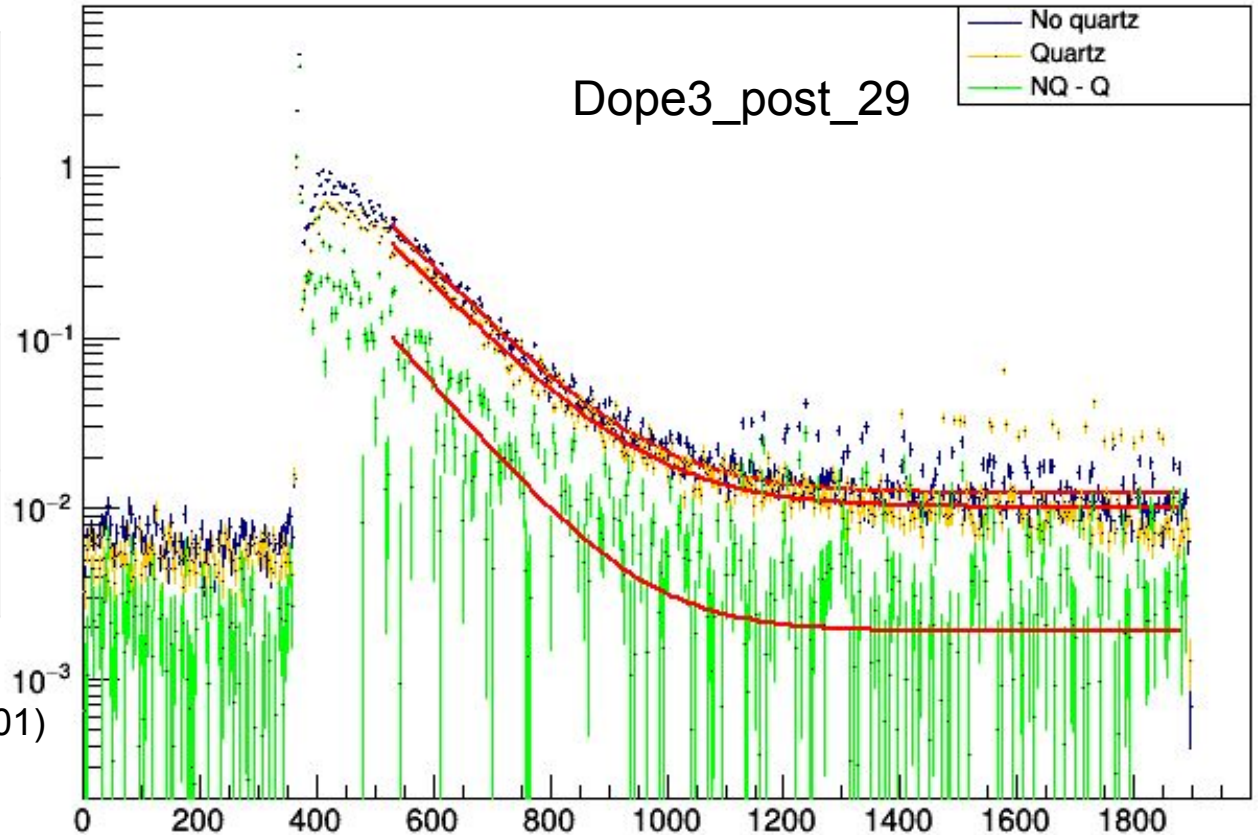

$$\text{Ar/Xe} = \text{Int}_{\text{Q}} / (\text{Int}_{\text{NQ}} - \text{Int}_{\text{Q}}) = 0.74(0.01)$$

NQ - Q <wfm>: start of doping 4

	<wfm> integral	τ_{slow} [ns]
NQ	50.9(0.1)	812(4)
Q	35.3(0.1)	838(5)
NQ-Q	15.6(0.1)	723(25)

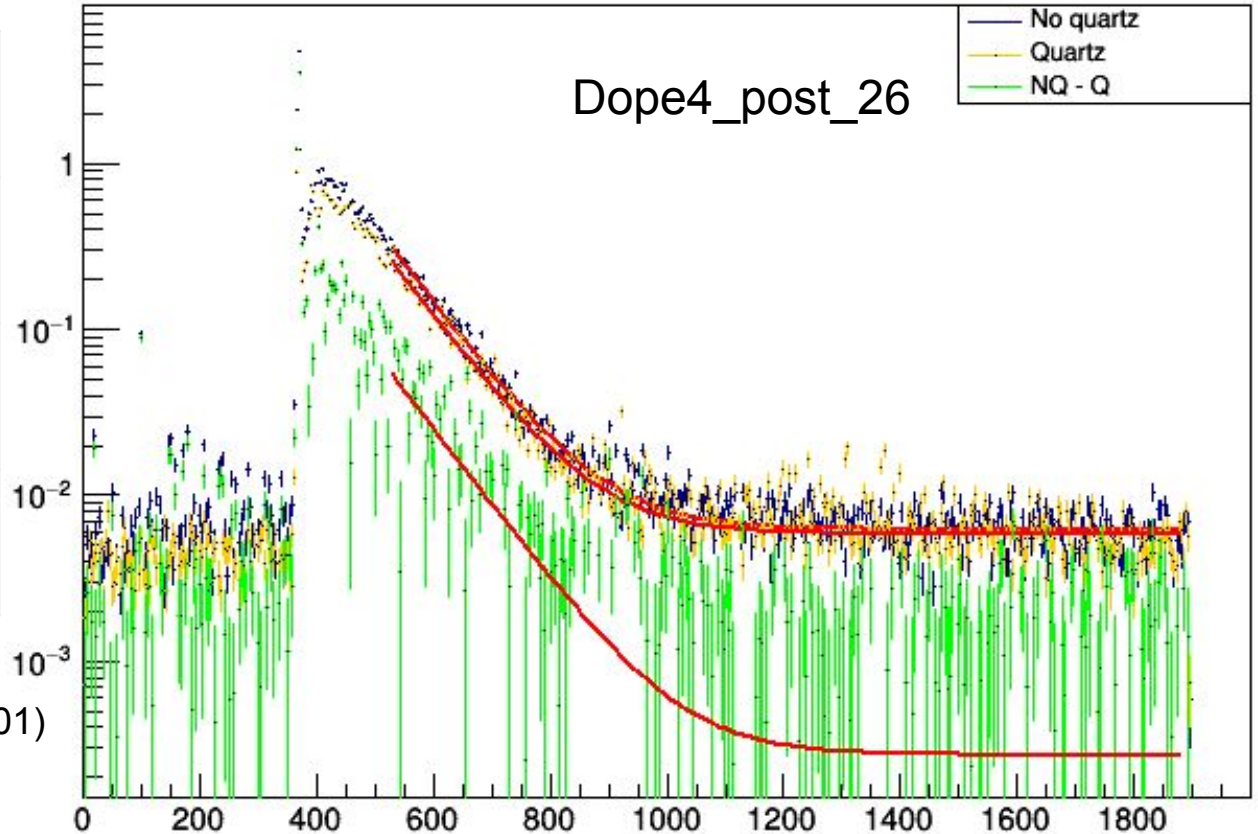

$$\text{Ar/Xe} = \text{Int}_{\text{Q}} / (\text{Int}_{\text{NQ}} - \text{Int}_{\text{Q}}) = 0.44(0.01)$$

NQ - Q <wfm>: end of doping 4

	<wfm> integral	τ_{slow} [ns]
NQ	39.6(0.1)	620(4)
Q	28.3(0.1)	619(4)
NQ-Q	11.3(0.1)	625(34)

$$\text{Ar/Xe} = \text{Int}_{\text{Q}} / (\text{Int}_{\text{NQ}} - \text{Int}_{\text{Q}}) = 0.40(0.01)$$

Conclusions

- Improved the $\langle wfm \rangle$ analysis by adding together the channels of a given XArapuca module and estimating the error on each point in the $\langle wfm \rangle$
- Obtained the residual Ar $\langle wfm \rangle$ s
 - as expected, the Ar/Xe light ratio decreases with doping

Doping period	Ar/Xe (integral ratio)
Start D1	1.75(0.03)
Start D2	1.24(0.01)
Start D3	0.74(0.01)
Start D4	0.44(0.01)
End D4	0.40(0.01)
