# Evolution for N<sup>3</sup>LO

- 🍏 A fundamental ingredient to use N<sup>3</sup>LO computations in extractions of PDFs is the **evolution** accurate to the same order.
- 🍏 The main ingredients to achieve N<sup>3</sup>LO accuracy in PDF evolution are:
  - 🍏 the  $O(\alpha_s^4)$  contribution to the anomalous dimensions, *i.e.*  $\beta_3(n_f)$  and  $P^{(3)}(x, n_f)$ ,
  - 🍏  $\beta_3(n_f)$  was computed long ago [van Ritbergen, Vermaseren, Larin, hep-ph/9701390].
  - 🍏 The **non-singlet** component of  $P^{(3)}(x, n_f)$  exact in the planar limit has been achieved only recently [Moch et al., arXiv:1707.08315]. **Singlet** still **unavailable**.
- 🍏 When a variable-flavour number scheme is used, **matching conditions** for the evolution of  $\alpha_s$  and PDFs accurate to  $O(\alpha_s^3)$  are also necessary.
  - 🍏  $O(\alpha_s^3)$  matching conditions for  $\alpha_s$  are known (see *e.g.* [Chetyrkin et al., hep-ph/0004189]).
  - 🍏 Matching conditions for PDFs fully known only up to  $O(\alpha_s^2)$  (in fact, matching conditions involving a heavy quark in the initial state are known to  $O(\alpha_s)$ ).
- 🍏 All the *currently known* ingredients necessary for PDF evolution at N<sup>3</sup>LO are implemented in **APFEL++**. [https://github.com/vbertone/apfelxx]
- 🍏 One may attempt, at least at small- $x$ , to use a fixed-order expansion as obtained from **HELL** [Bonvini, Marzani, arXiv/1805.06460] for the missing parts but... see Marco's talk.
