High Energy Physics – Experiment

Physics Briefing Book

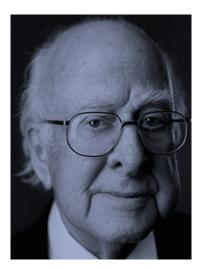

European Strategy for Particle Physics Preparatory Group

(Submitted on 25 Oct 2019)

The European Particle Physics Strategy Update (EPPSU) process takes a bottom-up approach, whereby the community is first invited to submit proposals (also called inputs) for projects that it would like to see realised in the near-term, mid-term and longer-term future. National inputs as well as inputs from National Laboratories are also an important element of the process. All these inputs are then reviewed by the Physics Preparatory Group (PPG), whose role is to organize a Symposium around the submitted ideas and to prepare a community discussion on the importance and merits of the various proposals. The results of these discussions are then concisely summarised in this Briefing Book, prepared by the Conveners, assisted by Scientific Secretaries, and with further contributions provided by the Contributors listed on the title page. This constitutes the basis for the considerations of the European Strategy Group (ESG), consisting of scientific delegates from CERN Member States, Associate Member States, directors of major European laboratories, representatives of various European organizations as well as invitees from outside the European Community. The ESG has the mission to formulate the European Strategy Update for the consideration and approval of the CERN Council.

Where next?

Personal view. I can identify the protagonist

in the next chapter of particle physics.

How well should we know Higgs properties?

OK: Claiming to have a measurement of something requires around 50% precision, to claim 2σ .

Better: Claiming to have discovered something requires around 20% precision, to claim 5σ .

Life goals: Quantum corrections* are around a few percent in the Higgs sector, so to claim to have probed the quantum nature, which we should, then aim for a few percent.

* By quantum corrections, I mean an extra factor of h compared to leading result. Nothing to do with tree-versus-loop...

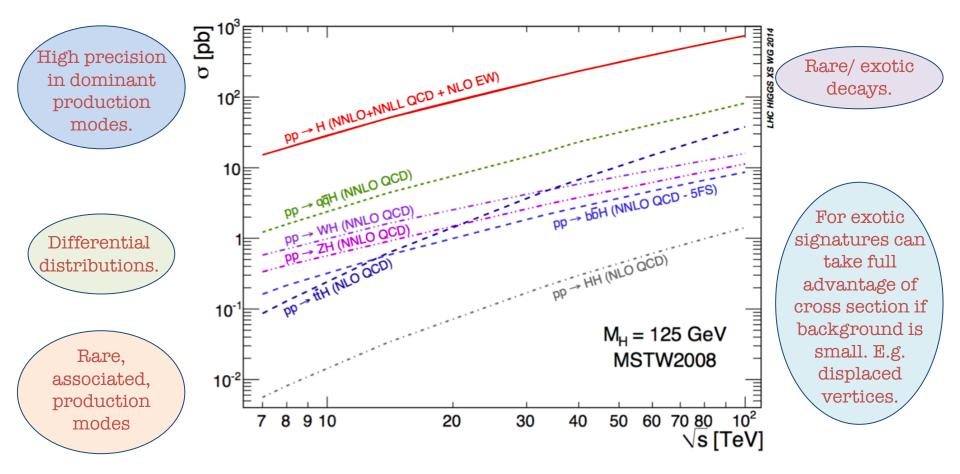

How well should we know Higgs properties?

Future colliders can realise many life goals.

But we all know there is more to physics than Kappas...

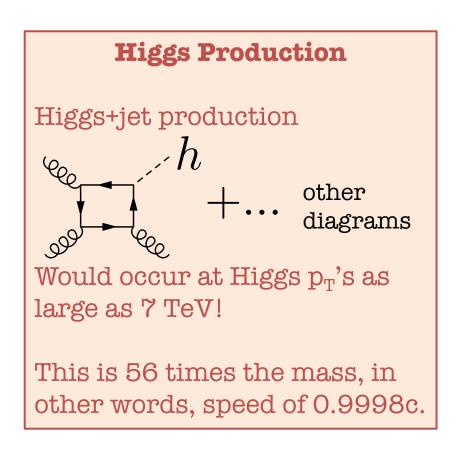

FCC-hh at Higgs Intensity Frontier

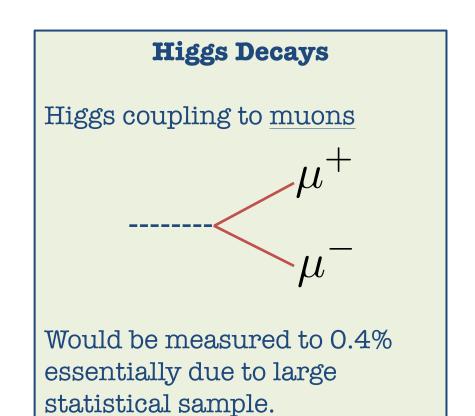

High energy also buys high precision. Not only for the Higgs, across the entire physics program.

FCC-hh at Higgs Intensity Frontier

At FCC-hh TEN BILLION Higgs bosons produced. Allowing to study extremely rare behaviour.

For systematic exploration we go beyond Kappas, to EFT.

Organizing the Unknown

To understand the origin and nature of the Higgs boson, we need to study how it behaves. $\mathcal{O}_T = \frac{c_T}{2M^2} (H^{\dagger} \overleftrightarrow{D}^{\mu} H)^2 \qquad \mathcal{O}_W = \frac{ig \, c_W}{2M^2} (H^{\dagger} \sigma^a \overleftrightarrow{D}^{\mu} H) D^{\nu} W^a_{\mu\nu} \qquad \mathcal{O}_{2B} = -\frac{c_{2B}}{4M^2} (\partial_{\rho} B_{\mu\nu})^2$ $\mathcal{O}_{2G} = -\frac{c_{2G}}{4M^2} (D_{\rho} G^a_{\mu\nu})^2 \quad \mathcal{O}_{\Box} = \frac{c_{\Box}}{M^2} |\Box H|^2 \quad \mathcal{O}_{WW} = \frac{g^2 c_{WW}}{M^2} |H|^2 W^{a \, \mu\nu} W^a_{\mu\nu}$ $\mathcal{O}_B = \frac{ig' c_B}{2M^2} (H^{\dagger} \overleftrightarrow{D}^{\mu} H) \partial^{\nu} B_{\mu\nu} \qquad \mathcal{O}_6 = \frac{c_6}{M^2} |H|^6 \qquad \mathcal{O}_{GG} = \frac{g_s^2 c_{GG}}{M^2} |H|^2 G^{a,\mu\nu} G^a_{\mu\nu}$ $\mathcal{O}_{H} = \frac{c_{H}}{2M^{2}} \left(\partial^{\mu} |H|^{2}\right)^{2} \qquad \mathcal{O}_{R} = \frac{c_{R}}{M^{2}} |H|^{2} |D^{\mu}H|^{2}$ $\mathcal{O}_{BB} = \frac{g^{\prime 2} \, c_{BB}}{M^2} |H|^2 B^{\mu\nu} B_{\mu\nu}$ $\mathcal{O}_{2W} = -\frac{c_{2W}}{4M^2} (D_{\rho} W^a_{\mu\nu})^2 \qquad \mathcal{O}_{WB} = \frac{gg' c_{WB}}{M^2} H^{\dagger} \sigma^a H B^{\mu\nu} W^a_{\mu\nu}$ Operators like those above capture leading effects of heavy physics beyond the standard model. Probing them could reveal origins.

 $\mathcal{O}_6 = \frac{c_6}{M^2} |H|^6$

The highest coupling-dimension operator.

The lowest coupling-dimension Higgs-only operator.

 $\mathcal{O}_6 = \frac{c_6}{M^2} |H|^6$

Parameterises BSM deviations in sole self-interaction of SM.

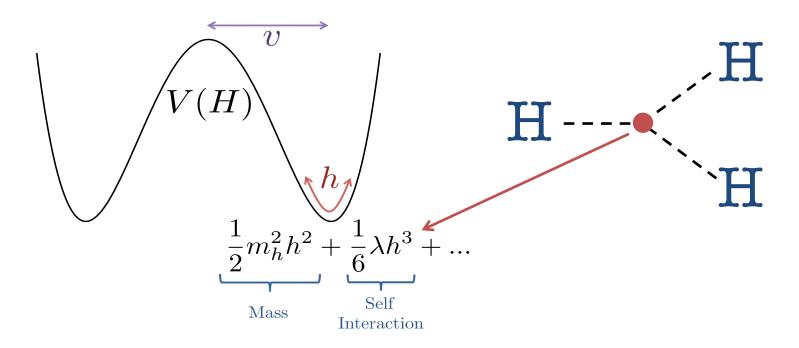

Parameterises BSM deviations in how the Higgs moves.

These operators are very special, both essentially unexplored and require future colliders.

A Unique Operator

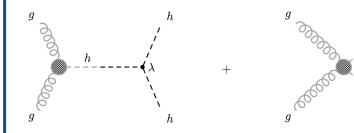

Measuring the Higgs self-coupling is the only way to probe the structure of the Higgs potential.

Discovering the Higgs was difficult enough, now we want to know how it interacts with itself...

A Unique Operator

At hadron colliders dominant production is via gluon fusion

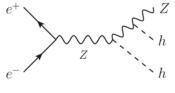

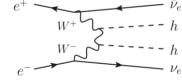

And most promising final state is

$$hh o b\overline{b}\gamma\gamma$$

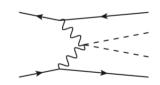

although a combination is better.

At lepton colliders a variety of pair production processes are possible.

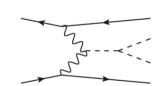

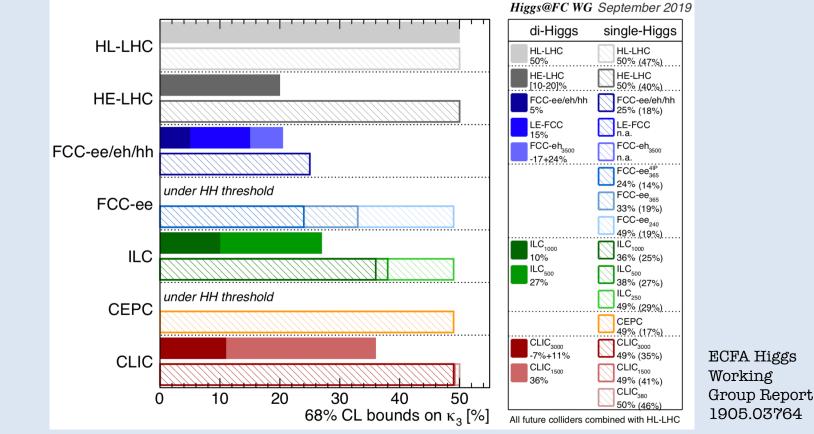

A clean detector environment helps as well.

A Unique Operator

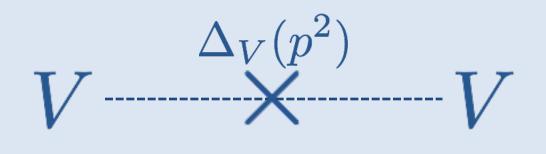

At high energies we can use Higgs pair production, at low energies quantum effects:

This is the future of the Higgs self coupling (Higgs potential)...

Oblique corrections have been a formidable toolkit in the effort to explore the electroweak sector.

- S-parameter
- T-parameter
- W-parameter
- Y-parameter

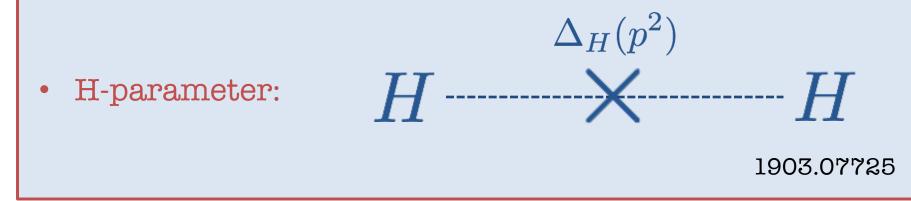

The latter two contribute to amplitudes in an "energy-growing" manner:

$$\Delta_W(p^2) \approx \frac{1}{p^2 - M_W^2} - \frac{\hat{W}}{M_W^2}$$

Making these oblique parameters an excellent target for hadron colliders...

Makes sense to extend to the Higgs sector. Especially since the Higgs can easily interact with new states...

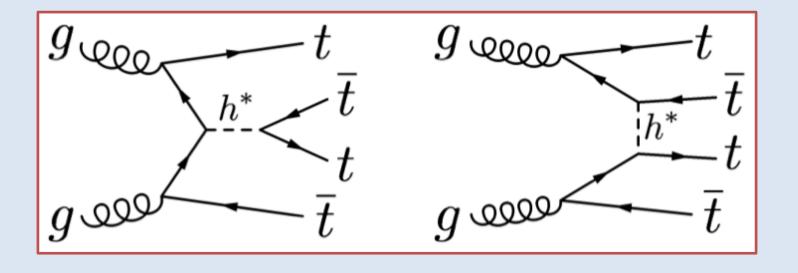

This also contributes to amplitudes in an "energygrowing" manner:

$$\Delta_H(p^2) \approx \frac{1}{p^2 - m_h^2} - \frac{\dot{H}}{m_h^2} + \dots$$

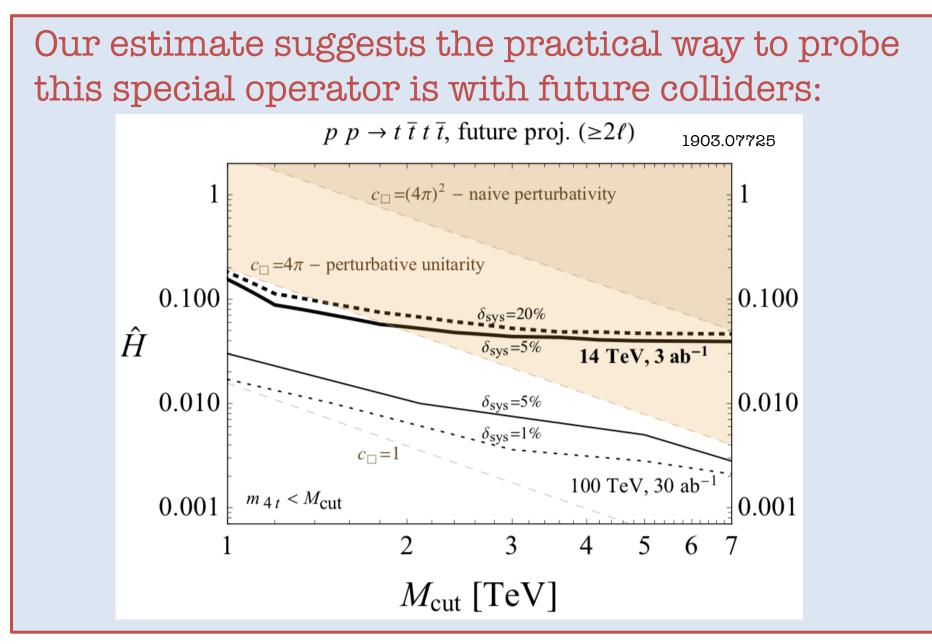

However, one needs to take the Higgs off-shell, which isn't easy...

Most promising avenue to take this Higgs off-shell is through four-top production:

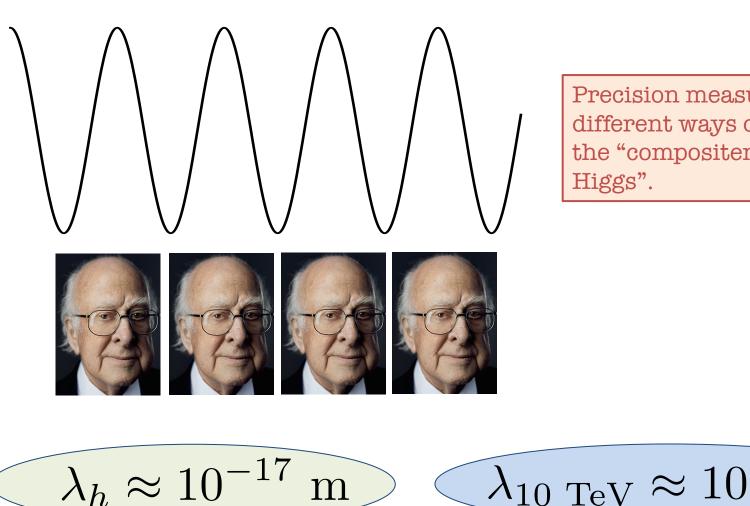

We may relate this Wilson coefficient to the scale of new physics as: \hat{H}

$$\frac{H}{m_h^2} = \frac{c_{\Box}}{M^2}$$

Is the Higgs Fundamental?

The Higgs boson has a size/wavelength. What's inside?

Precision measurements are different ways of probing the "compositeness of the Higgs".

Is the Higgs Fundamental?

If the Higgs is made up of constituents

$$H = \left(\overline{f}f \right) \int \sim f \qquad \qquad \xi \sim \frac{v^2}{f^2}$$

Could resolve some puzzles of the SM, providing the microscopic origin of Higgs, like QCD for pions.

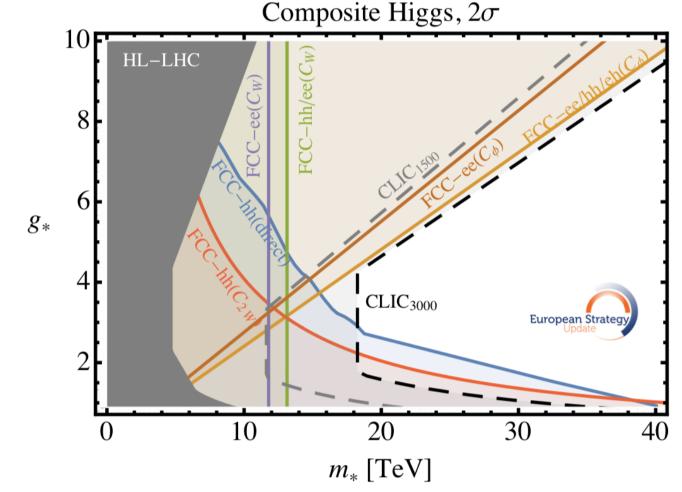

Such models can be thought of as realising the Higgs boson analogously to the pion in QCD.

$$\rho = \left(\overline{f} f \right) \right) \sim \Lambda$$

Should also get other heavy resonances then!

Is the Higgs Fundamental?

Including direct searches for the associated composite-sector mesons

provides valuable complementary information.

Or fundamental to small scales? Supersymmetry can stabilize the Higgs all the down to extremely short distances.

All Colliders: Top squark projections

Stop!

The stops are, arguably, the most most important players. But the heavier they are, the less effective they are.

Split SUSY? Unification? Neutralino DM?

Your choice.

(*) indicates projection of existing experimental searches

(**) extrapolated from FCC-hh prospects

 ϵ indicates a possible non-evaluated loss in sensitivity

ILC 500: discovery in all scenarios up to kinematic limit $\sqrt{s}/2$

Summary

Hmm...

Not geographically accurate.
