

# Model Validation and Cross-Section Extraction of Inclusive $\nu_\mu$ CC

Wenqiang Gu Brookhaven National Laboratory | wgu@bnl.gov

## 1. MicroBooNE

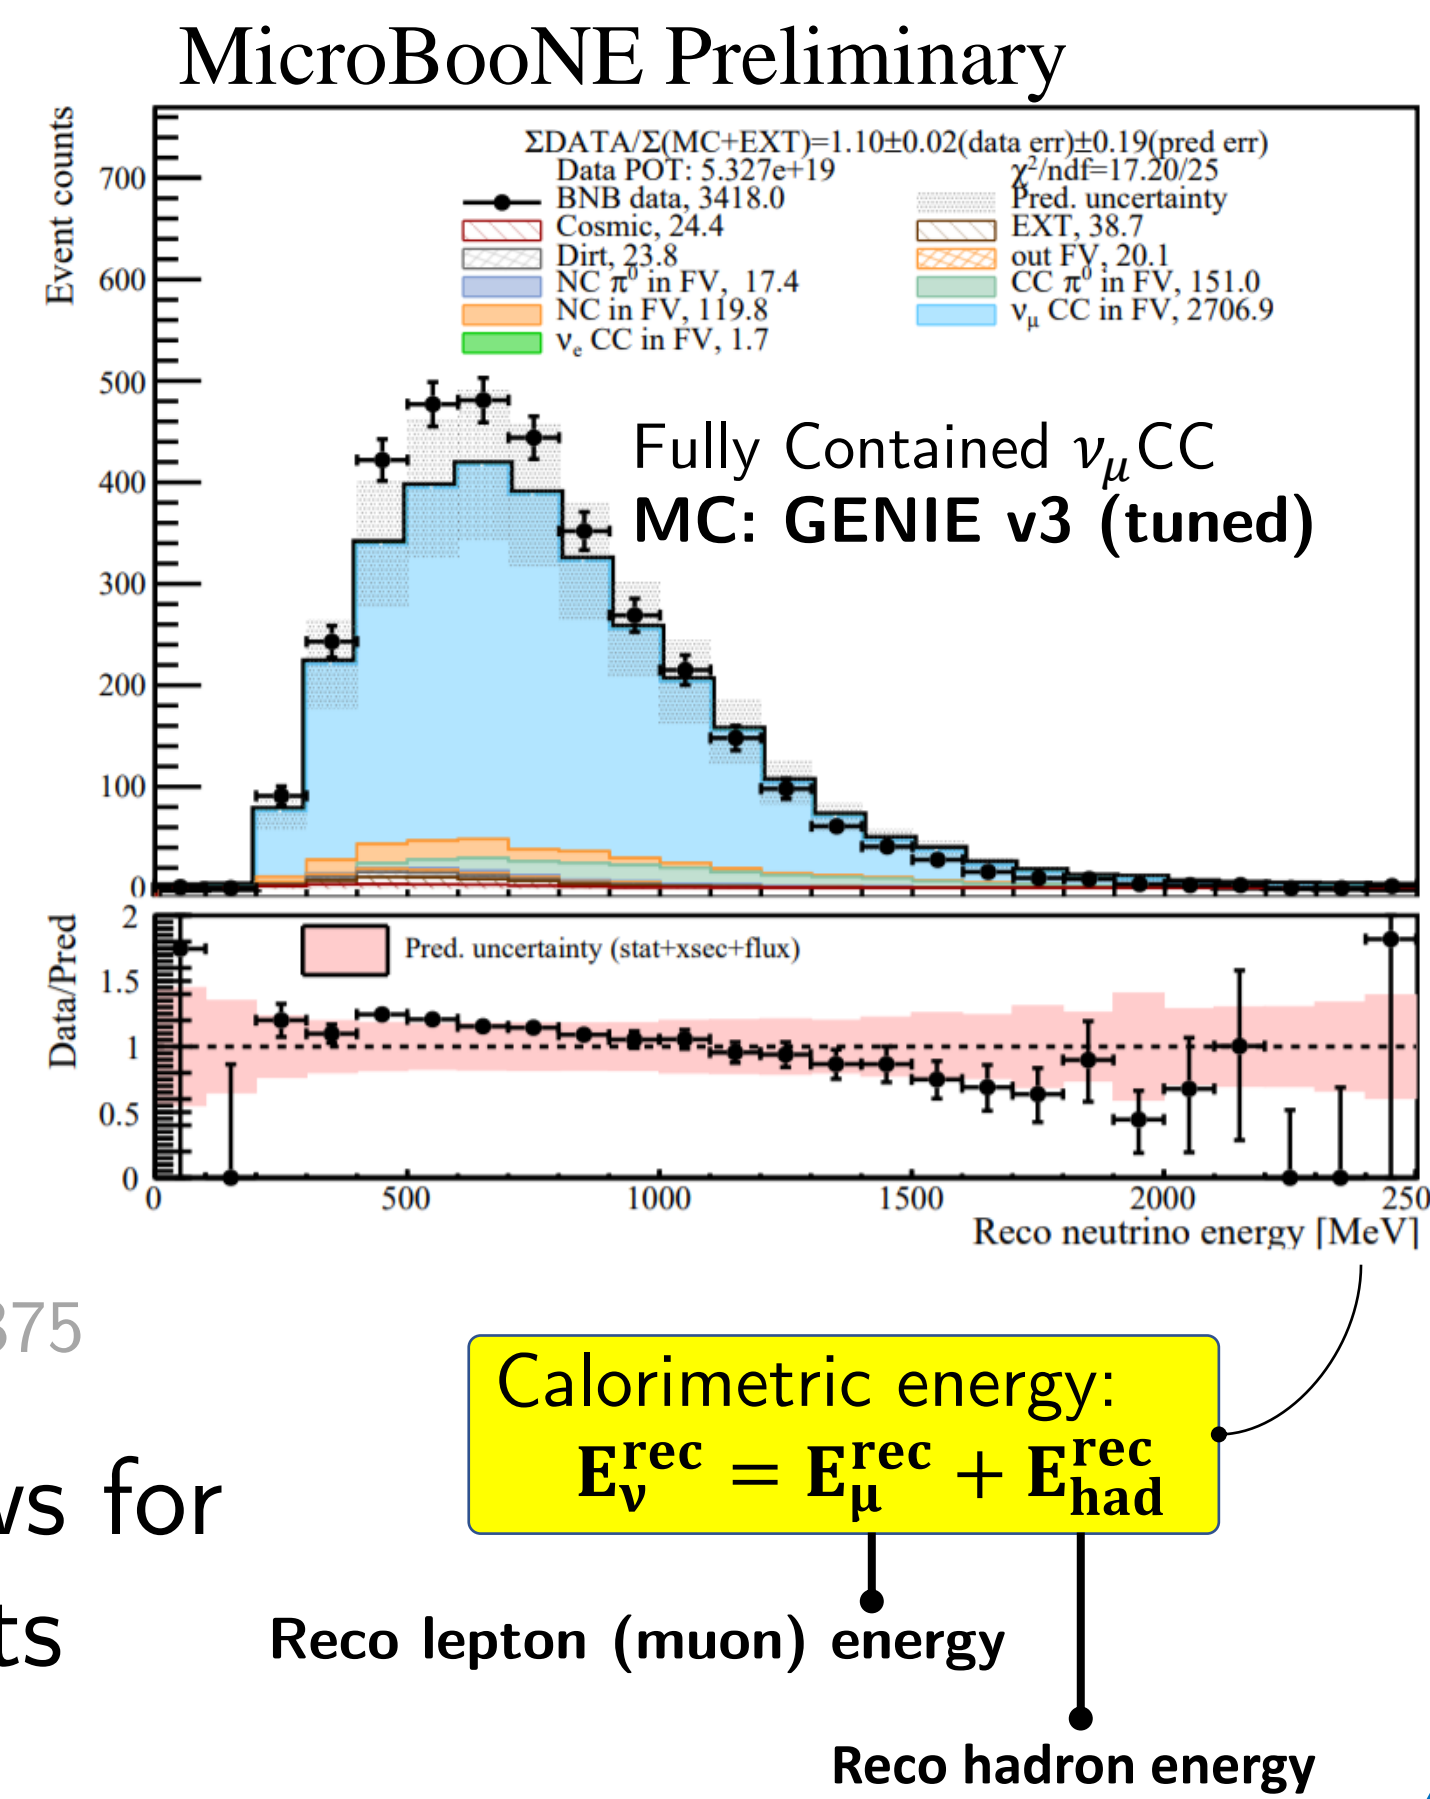

- Accelerator  $\nu$  experiment at Fermilab
  - LArTPC with 85-ton active mass
  - Near-surface operation
- Main physics goals
  - Investigate MiniBooNE low-energy excess
  - Measure  $\nu$ -Ar interaction cross sections

## 2. $\nu_\mu$ CC inclusive selection

	Efficiency	Purity	Cosmic- $\mu$ rejection
Trigger	1	5e-5	1
Generic- $\nu$ detection	80%	65%	7e-6
$\nu_\mu$ CC (Fully & Partially Contained)	64%	93%	7e-7

- Achieved excellent cosmic- $\mu$  rejection
  - Wire-Cell reconstruction: arXiv:2101.05076
  - Generic- $\nu$  detection: arXiv:2012.07928, arXiv:2011.01375
- The **high-statistics** event selection allows for high-precision cross-section measurements
  - MICROBOONE-NOTE-1095-PUB

## 3. Model validation: $E_\nu$ to $E_\nu^{\text{rec}}$

- Neutrino energy modeling is crucial for neutrino oscillation measurements
  - Key challenge: understanding  $\nu$ -Ar cross section as a function of energy
- A new procedure for validating  $E_\nu^{\text{rec}}$  from model prediction:
  - Reco muon energy and kinematics ( $E_\mu^{\text{rec}}$ ,  $\cos\theta_\mu^{\text{rec}}$ ) are verified with data measurement first
  - Reco hadron energy ( $E_{\text{had}}^{\text{rec}}$ ) is further validated given a **conditional constraint** of the muon kinematics

### Formalism of conditional Constraint

$$\mu_{X,Y} = \begin{pmatrix} \mu_X \\ \mu_Y \end{pmatrix}, \quad \Sigma_{X,Y} = \begin{pmatrix} \Sigma_{XX} & \Sigma_{XY} \\ \Sigma_{YX} & \Sigma_{YY} \end{pmatrix}$$

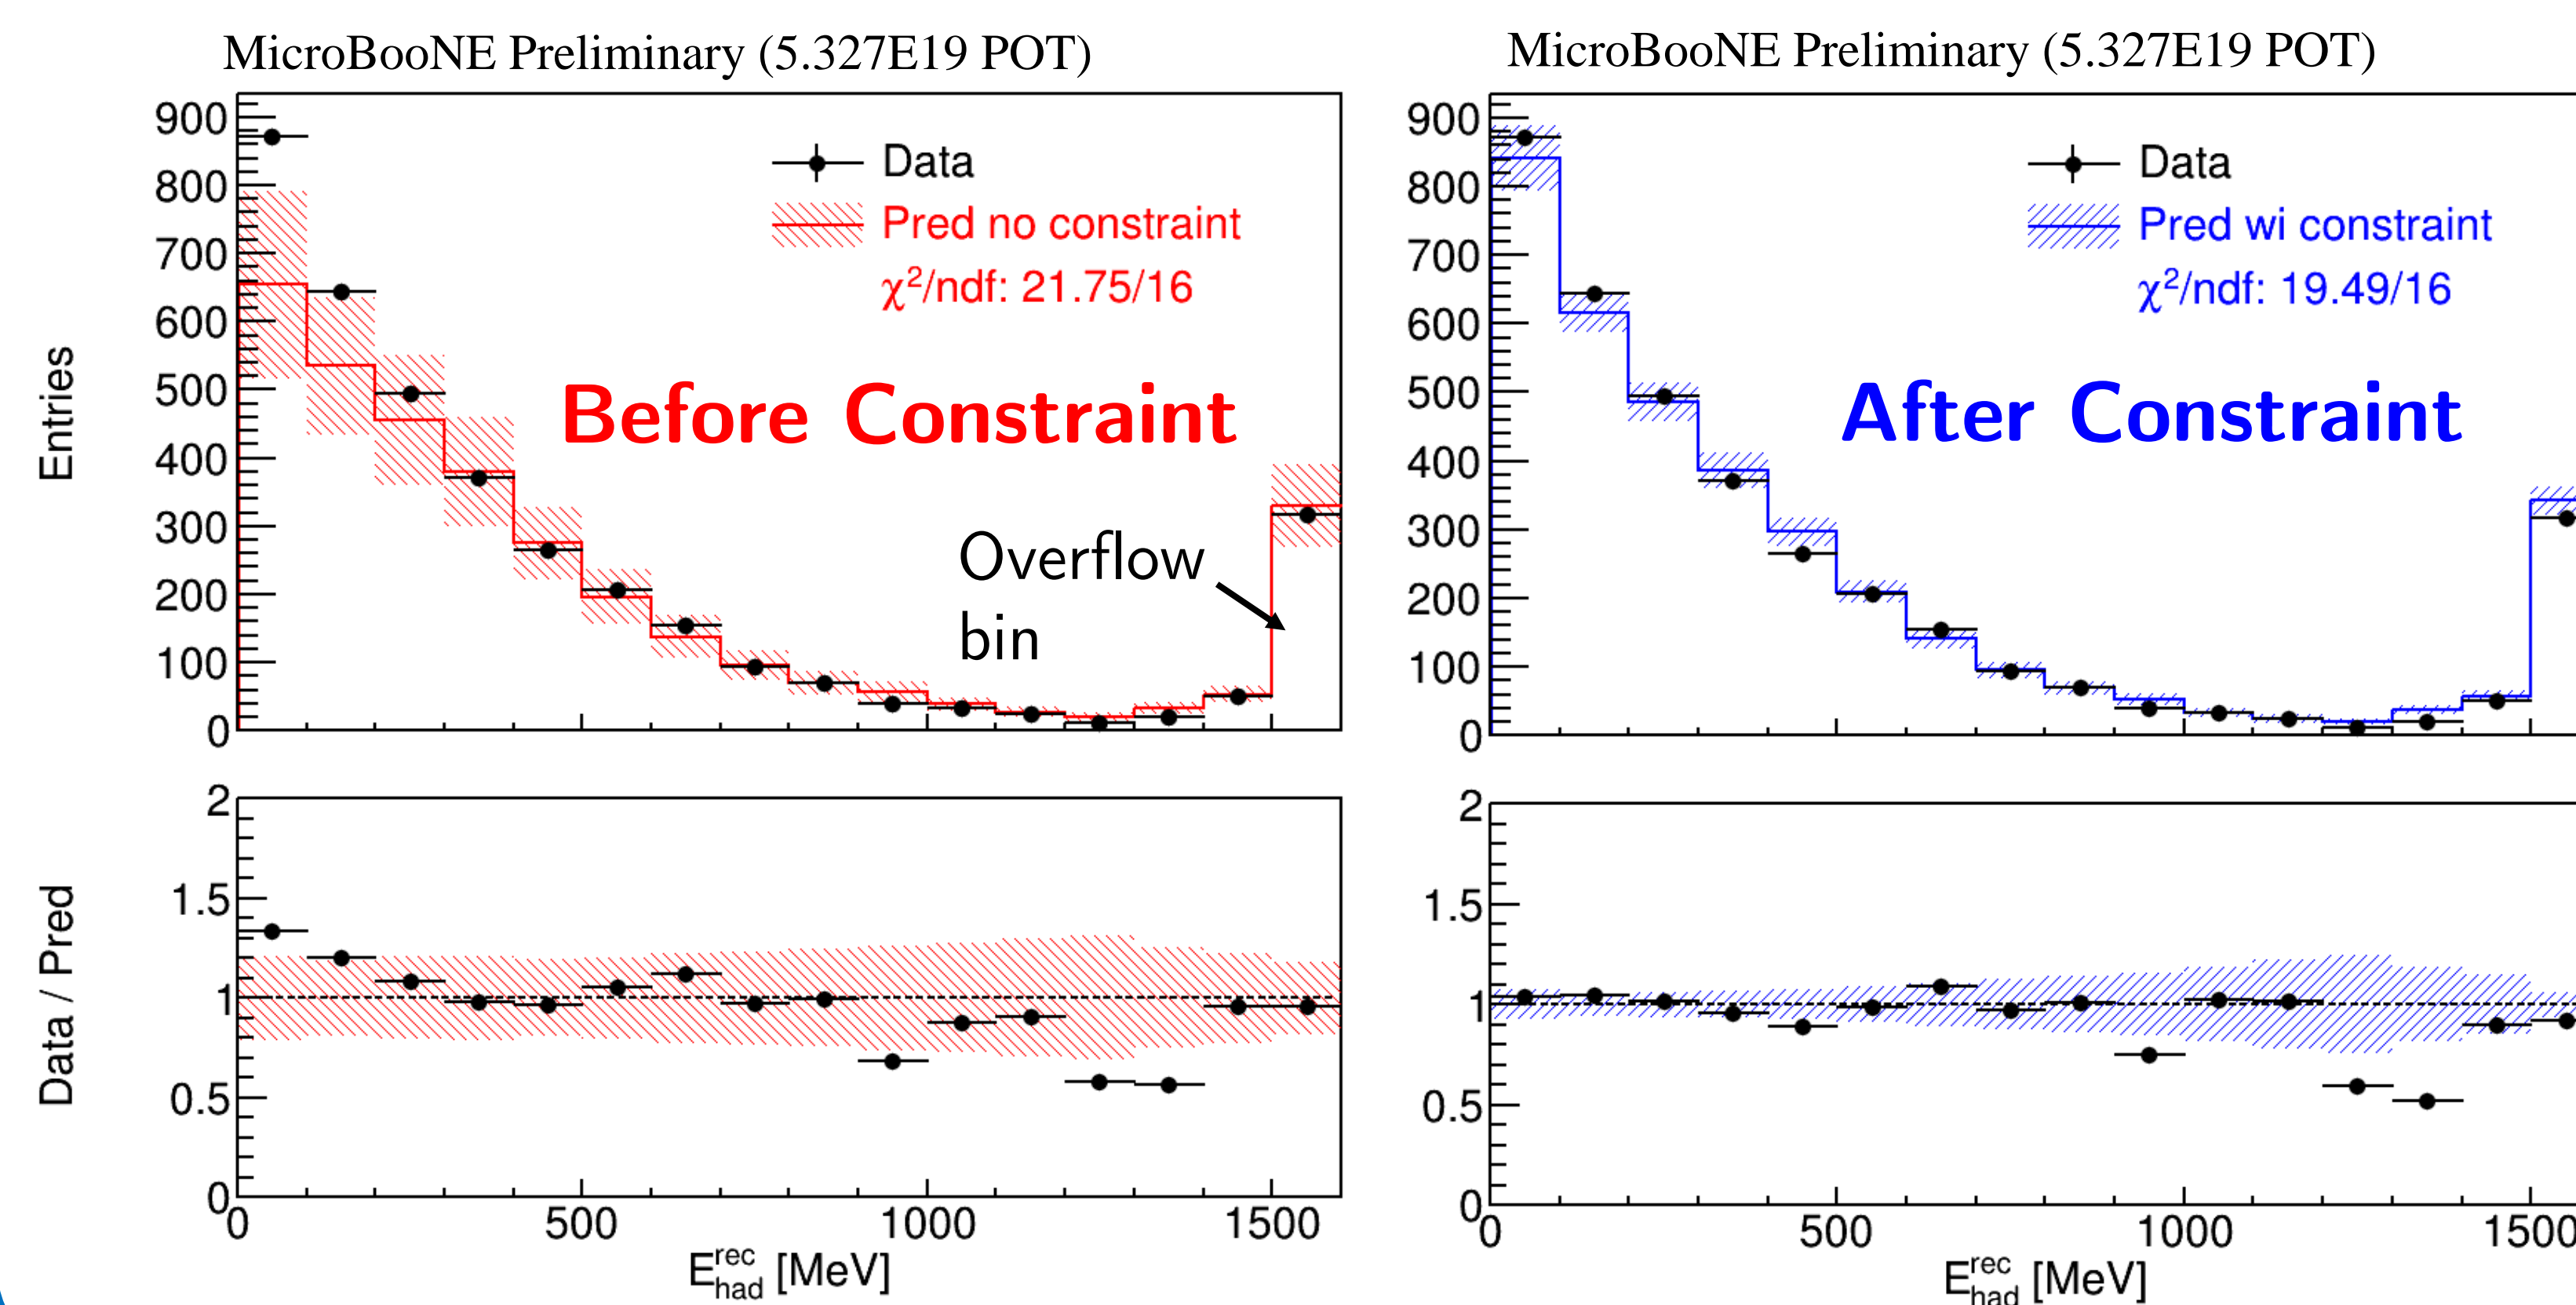

Joint mean                      Joint covariance

$$\mu_{Y|X}^{\text{constrained}} = \mu_Y + \Sigma_{YX} \Sigma_{XX}^{-1} (X - \mu_X)$$

$$\Sigma_{Y|X}^{\text{constrained}} = \Sigma_{YY} - \Sigma_{YX} \Sigma_{XX}^{-1} \Sigma_{XY}$$

- A data-driven correction for the model prediction of Y given a measurement of X
- Common systematic uncertainties (e.g., flux) are reduced  $\Rightarrow$  more stringent model validation

## 4. Validation of hadron energy reconstruction

- After constraint with  $E_\mu^{\text{rec}}$  and  $\cos\theta_\mu^{\text{rec}}$ : no more excess at low hadronic energy
  - Significant reduction in overall uncertainties (20%  $\rightarrow$  5%)
  - No sign of mis-modeling of the hadron missing energy

## 5. Towards a cross-section extraction

$$M(E_{\text{rec}}) = \underbrace{\text{Measured \# of events}}_{POT \cdot T} \cdot \underbrace{\text{Target nucleons}}_{\int F(E_\nu) \cdot \sigma(E_\nu) \cdot D(E_\nu, E_{\text{rec}}) \cdot \epsilon(E_\nu, E_{\text{rec}}) \cdot dE_\nu} + \underbrace{\text{Background}}_{B(E_{\text{rec}})}$$

Proton-on-target      Neutrino flux      Detector response

- Extract the cross section  $\sigma_{CC}(E_\nu)$  with data unfolding technique
- More dimensions are allowed:  $d\sigma_{CC}/dE_\mu$ ,  $d\sigma_{CC}/dv$ ,  $d\sigma_{CC}/dE_\mu d\theta_\mu$

MC folding vs. data unfolding (a re-smearing process to extract truth model)

$$M_i = \sum_j R_{ij} S_j \iff \hat{S} = A_C \cdot R^{-1} \cdot M$$

M: measured event distribution  
 S: binned true distribution  
 $R_{ij}$ : response matrix (reco bin i and true bin j)  
 $A_C$ : regularization, also applied to models when comparing result to theoretic predictions
