The 28th International Workshop on Weak Interactions and Neutrinos (WIN2021)

Contribution ID: **292** Type: **Poster session**

Reactor Antineutrino Flux and Spectrum Measurements at Daya Bay

The Daya Bay Reactor Neutrino Experiment consists of eight identically designed antineutrino detectors placed underground at different baselines from six 2.9 GW_{th} nuclear reactors in China. With the largest sample of reactor antineutrino interactions to date, and a tight control of systematic uncertainties, the experiment is able to determine the θ_{13} mixing angle, search for light sterile neutrino mixing, and characterize antineutrino emission from commercial nuclear reactors, with world-leading precision. In this talk, I will provide an overview of our latest results on these areas. I will also briefly review the prospects for the experiment.
