Time evolution of lepton number of Majorana neutrinos: the Schrödinger picture

T. Morozumi[‡], N. J. Benoit[†], Y. Kawamura[†] Weak Interactions and Neutrinos (WIN) 2021 [†]Graduate School of Science, Hiroshima University; [‡]Graduate School of Advanced Science and Engineering, Hiroshima University;

Motivation

In our past work we studied the time evolution of lepton number (L) of Majorana neutrinos by constructing the Heisenberg operator for it . The initial state is a neutrino state with a definite lepton number but is not a mass eigenstate. The expectation value of L oscillates. we study the same phenomena by adopting the Schrödinger represetation.

Questions:

1) Time evolution of the state will be clarified 2) The understanding of the difference of two vacua one which the operator with a definite lepton number operates and the other on which the massive Majorana operator acts on.

Goals

Starting with an initial state with a definite lepton number and let it evolve with respect to time and construct the state at arbitrary time. With the state, one can compute the expectation value of lepton number.

 $<\Psi(0)|L_H(t)|\Psi(0)>=<\Psi(t)|L_S|\Psi(t)>$ One can also check the previous result in Heisenberg rep..

The state at time t is derived.

 $|\psi(t)\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_{M+}(q) \} a^{\dagger}_M(q,-) \, |0_M\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_{M+}(q) \} a^{\dagger}_M(q,-) \, |0_M\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_{M+}(q) \} a^{\dagger}_M(q,-) \, |0_M\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_{M+}(q) \} a^{\dagger}_M(q,-) \, |0_M\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_{M+}(q) \} a^{\dagger}_M(q,-) \, |0_M\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_M(q) \} a^{\dagger}_M(q,-) \, |0_M\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_M(q) \} a^{\dagger}_M(q,-) \, |0_M\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_M(q) \} a^{\dagger}_M(q,-) \, |0_M\rangle_q \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \{\cos \phi_q + i \sin \phi_q \, e^{-i 2E_q t} B^{\dagger}_M(q) \} a^{\dagger}_M(q) \ = \ N_q \sqrt{\cos 2\phi_q} e^{-\mathrm{i} \mathbf{E}_q t} \ = \$

The Fock state with a momentum q is a superposition of a massive Majorana state and a state with a Majorana particle accomodated with a pair of Majorana particles. The mixing of the latter state is maximum for the velocity zero limit.

Results of the time evolution of L is the same as that obtained by Heisenberg picture.

(1) Relation bet. neutrino and anti-neutrinos creation and annhilatio and massive Majorana particles with different helicities (h) (aM(p, obtained in the form Bogoliubov transformation. (2) Rewrite the lepton number operator which is originally written with a and b in terms of operators of massive Majorana neutrinos.

$$L = \int_{p \in A}^{\prime} \frac{d^{3}p}{(2\pi)^{3}2|p|} \{(a) \\ L = \int_{p \in A}^{\prime} \frac{d^{3}p}{(2\pi)^{3}} \frac{p}{2E_{p}^{2}} \{(a) \\ + \int_{p \in A}^{\prime} \frac{d^{3}p}{(2\pi)^{3}} \frac{im}{2E_{p}^{2}} \{(a) \\ + \int_{p \in A}^{\prime} \frac{im}{(2\pi)^{3}} \frac{im}{2E_{p}^{2}} \{(a) \\ + \int_{p \in A}^{\prime} \frac{im}{(2\pi)^{3}} \frac{im}{2E_{p}^{2}} \frac{im}{2E_{p}^{2}} \frac{im}{2E_{p}^{2}} \{(a) \\ + \int_{p \in A}^{\prime} \frac{im}{(2\pi)^{3}} \frac{im}{2E_{p}^{2}} \frac$$

$$|0\rangle = \prod_{p \in A}' (\cos^2 \phi_p |0_M\rangle_p - \sin^2 \phi_p |4_M\rangle_p + i \sin \phi_p \cos \phi_p |2_M\rangle_p)$$

Bogoliubov transformation.

$T_p(\phi_p)$	=	$\operatorname{Exp}[i(g]$
$g_{\lambda}(p)$	=	$\alpha_M(p,\lambda)$
$\alpha_M(p,\lambda)$	=	$\frac{a_M(q)}{\sqrt{2E_p(2\pi)}}$

Results

 $\langle \psi(t) | \hat{l}_q | \psi(t) \rangle = v^2 + (1 - v^2) \cos \left| \frac{2mt}{\sqrt{1 - v^2}} \right|$

Method

 $a_M^{\dagger}(p, -)a_M(p, -) + a_M^{\dagger}(-p, -)a_M(-p, -) - a_M^{\dagger}(p, +)a_M(p, -)$

 $\{a^{\dagger}_{M}(p,-)a^{\dagger}_{M}(-p,-)-a_{M}(-p,-)a_{M}(p,-)-a^{\dagger}_{M}(p,+)a^{\dagger}_{M}(-p,+)+a_{M}(-p,+)a_{M}(-p,+)a_{M}(p,+)\}$

 $q_{+}(p) + g_{-}(p))\phi_{p}$ $lpha_M(-p,\lambda) + lpha_M^{\dagger}(-p,\lambda) \, lpha_M^{\dagger}(p,\lambda)$ ${(p,\lambda)\over \overline{\pi)^3\delta^{(3)}(0)}}$ (Dimensionless operators)

$$(p,+) - a_M^{\dagger}(-p,+)a_M(-p,+))$$

The vacuum with 0 lepton number is expressed by the state in which one and two pairs of the Majorana neutrinos are condensed.

> $B_{M\lambda}^{\dagger}(p) = \alpha_M^{\dagger}(-p,\lambda) \alpha_M^{\dagger}(p,\lambda)$ $\cos\phi_p = \frac{\sqrt{1+v_p}}{\sqrt{2}}$
