

BENCHMARK MODELS FOR INCLUSIVE DARK SHOWER SEARCHES

Jessie Shelton
UIUC
with S. Knapen and D. Xu

Snowmass EF09-EF10 topical meeting on dark showers
Aug. 13, 2020

PROPOSAL: LOW-MASS DARK SHOWER SEARCH PROGRAM

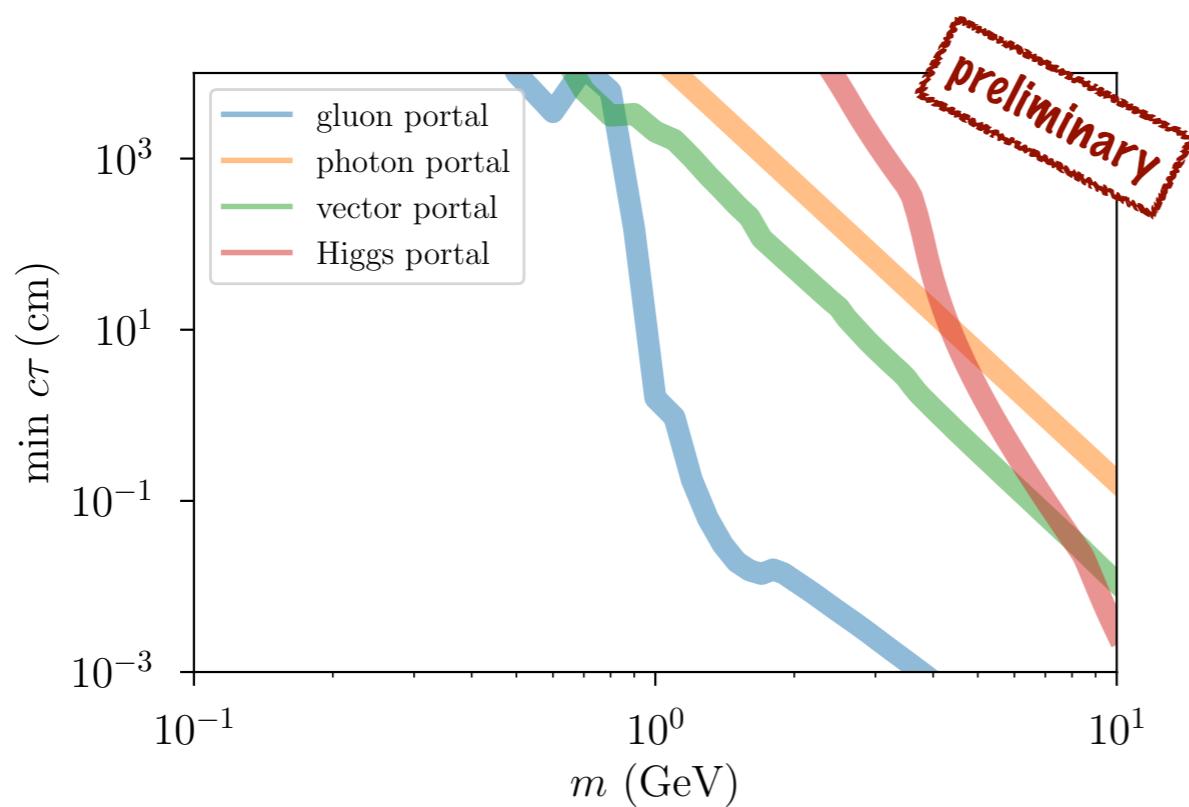

- Primary focus: dark showers produced in decays of SM Higgs
 - minimal; well-motivated
 - low mass final states: challenging benchmark for trigger development
- High multiplicity final states $\Rightarrow \lesssim 10$ GeV-scale dark hadrons
 - but then generically SM-decaying dark hadron is long-lived
- “Dark showers”: $\gtrsim 3$ displaced objects/event
 - Clean signature; enables inclusive searches
 - Strategy: use QCD-esque benchmarks, prioritize inclusivity
 - (see: dark showers chapter of LHC LLP white paper, arXiv:1903.04497)

LIGHT DARK HADRON DECAYS

- Decay portal operators: different visible signatures

Decay portal	decay operator	features
gluon portal	$aG^{\mu\nu}\tilde{G}_{\mu\nu}$ or $\phi G^{\mu\nu}G_{\mu\nu}$	hadron-rich
photon portal	$aF^{\mu\nu}\tilde{F}_{\mu\nu}$ or $\phi F^{\mu\nu}F_{\mu\nu}$	photon shower
vector portal	$\rho'^{\mu\nu}F_{\mu\nu}$	semi-visible jet
Higgs portal	$\phi H^\dagger H$	heavy flavor-rich
dark photon portal	$aF'^{\mu\nu}\tilde{F}'_{\mu\nu} + \epsilon F'^{\mu\nu}F_{\mu\nu}$	hadrons + leptons

- Light dark mesons are generically long-lived*

- Choices to minimize allowable $c\tau$
- * Theory prejudices apply: e.g.
 - small anomalous dimensions
 - avoiding tree-level fine-tunings

BENCHMARKS AND MONTE CARLO TOOLS

- Dark hadron multiplicities: **highly model-dependent**, not calculable
- Benchmark models using these decay portals implemented using Pythia HV module
 - default production through SM Higgs; other options possible
 - simplified hadron sector (ω , η); two choices of meson mass hierarchy to toggle visible multiplicities
 - user can set free parameters, e.g.: meson mass scale, N_f (invisible)

Will make associated tools for driving Pythia HV available in a public repository

DARK HADRON MULTIPLICITIES

► Multiplicities per event:
